receive the messages. But the individual pager id will
probably be changed immediately so you won't be able
to use it for your personal messages.

Note also that some pagers -do- have the ability to be
turned into a lump of clay over the air. Very few systems
have actually implemented this security feature, but it
is there.

8) I've found a pager on the sidewalk and would like
to use it. What can I do?

Not much. Keep in mind that you need an account with the
paging company for them to send out the radio signal. So
unless you keep paying them, the pager will soon be
a paperweight.

You might as well turn it in for the reward...

9) Can I listen in/monitor pager channels?

Kind of. The frequencies are readily known and the data
is a digital stream going over the air. There are various
vendors of equipment to decode the material and display
it or feed it into your computer. However:

a) The federales and the pager companies don't like
you doing this (see the ECPA)
b) The volume of traffic is quite high. If you figure a 1,200
baud channel in use 75% of the time, well,... you can
work out the math.

Note that the numeric pagers these days do -NOT- use
over-the-air touch tone (dtmf) so a touch tone decoder
will -NOT- give you anything useful.

10) I have a pager for which I'm paying $big/month. I miss a -lot-
of pages since I'm in the subway a lot. What can I do about
this?

There are a couple of things:

a) Some of the pager companies will re-send messages on
request. Basically you call up their phone number, punch
in a security code, then go through a menu which tells them
to resend the last, say, five hours worth of messages.

b) You can get a second pager unit cloned identically to
the first. leave this one at home or in your office. When you
get back you can compare its messages to the one on your belt.

11) What are the prices/services offered?

These vary dramatically by area and company. Unfortunately
there is no central database keeping records on this.

Generally the following factors get counted in determining
what you'll be paying:

a) how sleazy the company is
b) Which type of pager and service you get. Again, the
most common are numeric (cheaper) and alpha-numeric (more expensive).
c) Level of usage. You may get, say, 25 free messages/month
and then pay $0.25 for each additional.
d) whether you own the pager or lease it
e) insurance, etc.
f) Area of coverage. Smaller area=less expensive

12) Speaking of coverage, how do they offer nationwide paging?

Well, it's not quite what they're telling you. It's NOT a single satellite covering the nation. Rather, what's done is:

You call up the paging company. It then signals transmitters in the top 100 cities to send out your capcode. Shortly afterwards you get the message. Note that you are -not- receiving a satellite transmission.

13) What's in the pipeline?

Two key features are slowly filtering down.

a) Much more pager memory/longer messages. Most pagers are severely limited in the amount of material they can hold, with a typical maximum being about 20 messages. Units with much larger memories, or even better, units that are hooked into palmtop or laptop computers, are making it to market.

b) two way communications: In its simplest form this allows the pager to verify reception to the transmitter. Also on the way is complete two-way communication which would basically be wireless email. These systems are still a bit limited, but are rapidly gaining footholds in industry and should soon be consumer level. Take a look, for example, at what the Fedex folk carry.

Hope this help. Again, update suggestions should be sent to

dannyb@panix.com

>the US. Most scanners that don't receive aircraft don't have an "AM"
>position and aren't able to detect AM signals.

Actually it would not be unusual at all. Most "FM" scanners do not have
very much limiting in their receivers. Limiting is the function that reduces
interference from AM signals and noise. An AM signal that doesn't get
limited will be demodulated. Additionally, AM signals have some FM
charcteristics as both generate sidbands (FM more than AM) which make the
bandwith of the signal change in relation to the modulating (audio) frequency,
though not in exactly the same way.

My older PRO33 does quite a good job at picking up aircraft (usually when I
don't want it to). It is not very hard to build a receiver that will receive
FM and AM. The differences between the two could be handled in the audio
portion of the receiver.

>I've never heard this one.

He was kidnapped, tortured, and finally decapitated in a bizarre religious ritual by rogue members of the so-called "Church of the Sub-Genius" in 1988. In order to avoid being blamed for the crime, the Church's orthodox hierarchy built an android replica of Trevino and released it back into the Senior Gold circuit. The android's propensity to do untested product endorsements has been considered worrisome to the Church elders, but not enough to warrant the fuss of pulling the android out of circulation for a full debugging job.

This may, of course, be slightly apocraphal.

> number (at least that's what happens here in Maryland).

It is against carrier policy to do this and with somewhat good reason. Mor
on that later. It is not ILLEGAL. This is probbably the best thing a couple
could do if all that they have their phones for is safety. If you expect to
receive zillions of calls then I recommend paying for a second phone.

The reason why the carriers don't like it is because if one phone is roaming
and they are both on, where does the call get routed? It usually gets dropped.

If the carrier locked out your number I would just act ignorant to technology
and claim that a criminal must have stolen my 'phone address'. They would
have your phone working in a few hours.

Believe it or not, they use one at the WABC-TV Assignment Desk.
I've seen/heard it in action there and it actually seems to do
a great job. However, a freelance photog friend
has one in his car, along with a slew of other scanners, and
says he can't even turn it on until he's well away from
the City -- too easily overloaded by intermod. Last I saw,
Scanner World (518-436-9606) still had them in stock.

> I agree with you 100%!

I must admit, that I agree with both of you also. I would **MUCH** rather listen to my local police and fire departments and hear things that can affect my neighborhood and community, instead of listening to who is doing who behind who else's back. My first reaction when a friend tells me what they heard on cellular phone is usually along the lines of "get a life, man!"

HOWEVER (and you all should have known a "however" was coming), whether or not I actively listen to it, I do think that so long as the cellular companies use the PUBLIC radio spectrum (and its *ALL* public) I firmly believe in the right of the people to monitor those frequencies if they so choose. If they want privacy, then don't broadcast it! If the cellular companies don't want me to have the capability of listening to their stuff, then they need to quit broadcasting it onto my property! Same with satellite TV companies, and any other service that uses the public airwaves.

Enough said, and I'll take my asbestos underwear in a size XL please...

David
davidm@iglou.com

(And just a gentle reminder, I'll still email the ECPA to anyone who needs it and can't find it elsewhere...one of these days I may even get around to posting it to an ftp site if it isn't already available somewhere...)

Look, I'm sure we all agree that this is NOT the appropriate newsgroup
for this material. So, LET IT DROP or take it to alt.flame.??????????
I read this group for scanner information and nothing else. I'm sick of
it and I'll bet that 99% of the other subscribers are too.

6210. What is the FCC Radio Service Code "IV"??

Newsgroup: rec.radio.scanner
Date: 1994-07-11 13:03:02 UTC
From: lee@tosspot.sv.com
Message-ID: <RFVaPc1w165w@tosspot.sv.com>
Source record: 271917

Found "IV" showing up as data in the RSC field - seems to be something to do with video.

Anyone know what the FCC describes this service code as??

Lee

6211. Comments solicited on the Bearcat 220XLT and 120XLT

Hi, all.

I notice my friendly neighborhood Damark catalog is pushing the BC220XLT and BC120XLT. Prices are $250 and $170 respectively.

Anyone have comments on price and features/value for money of these things? I presume that they cover cellular as well? (Given that you get old stock rather than new?) Are they still current offerings from Bearcat?

Any comments would be appreciated, please email me directly as well as posting to the net.

Thanks,
Lee <lee@tosspot.sv.com>

Find your way onto the Compuserve libraries. In the Hamnet section there are some control programs. I think the command format is defined in the owners manual.

There is a surplus electronics store in Sunnyvale called Halted that gives it
out free. I think it is located on Ryder, just off Central Expwy.

6214. followup to "USAir and Scanners"

Newsgroup: rec.radio.scanner
Date: 1994-07-11 14:47:55 UTC
From: scsavett@acad.ursinus.edu
Message-ID: <00981432.D27DCD80.27275@acad.ursinus.edu>
Source record: 271919

This is a followup to a question I posed about a month ago about scnners and airlines. I found this on sci.electronics. It seemed to capture the essence of most of the responses I recieved, although this specific message addressed the problems of a laptop computer on an airplane.

****begin forwarded message****
>Sorry, you are misinformed - A radio tunes to a particular station by
>broadcasting on a frequency just below the station you want to listen
>to. On AM, the radio transmits 455KHz below and on FM, the radio
>broadcasts 10.7MHz below the station you are tuning.

>For example, if you are listening to 101.7 on your FM dial, your radio is
>actually transmitting a difference signal of 101.7 - 10.7 = 91.7MHz

>This difference approach allows radios to be built less expensively.

Actually, this difference approach is what gives radios their high degree of selectivity (the ability to detect stations that are close together. It cost more to build a radio in this manner.

(Bunch of stuff deleted)

What really happens is this. You have a device called a local oscillator (LO) that is 10.7 MHz (for FM) below the station frequency. The incomming frequency is amplified and combined with the local oscillator frequency in a device called a mixer. This mixer produces a difference frequency of 10.7 MHz (this is called IF, or Intermediate Frequency), which is sent to a chain of narrowband IF amplifiers and finally the FM detector. This scheme is called a superhetrodyne receiver, and is found in all medium and high quality receivers.

The mixer is an interesting beast. By and large, it does a pretty good job. Unfortunately, it is not 100% efficient, and you tend to get some frequency leakages. One thing that you do get is the second harmonic of the IF frequency, which tends to mix back into the local oscillator and produce frequencies of 10.7 MHz ABOVE the station frequency you are listening too. The filters in the radio cause this to be ignored, and do not disturb the radio reception. These frequencies are radiated, however, and can be picked up by a receiver tuned to these frequencies. AM radios work the same way, except that the LO is tuned to 455 KHz below the carrier frequency.

On an airplane, what receivers are tuned to these frequencies?

Well, the ILS localizer (the radio instrument landing system) uses frequencies of 108-112 MHz. The VHF Omnirange(also known as the VOR) navigation system (a crucial air navigation system) operates on frequencies of 108-118 MHz. Standard ground-air radio operaties on frequencies between 118-132 MHz.

As you can see, an FM radio operating in an aircraft will radiate frequencies right over the aircraft's radio navigation frequencies. For example, an FM radio tuned to a station who's frequency is 101.7MHz, will transmit a harmonic of the IF frequency at 112.4 MHz, which can screw up the VOR reception or, if the plane is landing, the ILS. The latter will cause the instruments to think the plane is lined up with the runway when it is not. The former, will through the plane off course. Neither of which is healthy to do in an aircraft.

Laptop computers, because their frequencies are digital (square waves), are rich in harmonics. There are several different oscillators in the computers these days (the main cpu clock, the display scanning frequency, the timer frequency, etc.), and these frequencies (and their harmonics) can mix, and these resultant frequencies can extend well into the radio navitation bands (described above) at enough power to affect the aircraft's radio navigation instruments.

I hope this clears up this issue, and we can get back to discussing winsock stuff. I am crossposting this to sci.electronics, since they also might have an interest in this as well.

The cheapest way is to get a TV signal attenuator from Radio Shack. You will have to get some adaptors.

For best results, select Wide Band FM if your scanner has such a
setting. The following list is a very complete listing I happened
to save when it was posted a year or so ago... Since the only
responses I have seen to your question only include the audio
frequencies, and only partial spectrum, I repost the following:

: Steven...
: From several RS people that hang out in CompuServe and Fido Scanradio,
: this unit is being discontinued. On the horizon is a replacement that will
: have 1000 channels, 100 / bank. Judging by the response of this unit, the
: '2006 could be an excellent unit in holding it's value.
: The new unit will also be cheaper in construction and have no cellular
: modifiable capability. That's the word.

I will not be buying any more new scanners from U.S. Dealers until
the cellular ban is repealed. I should be able to get one of the
new 1000 channel units from Tandy U.K. and purchase a 13.8v DC
AC adapter for it. I will be purchasing it "officially" for purpose
of possession, (as someone put it), to store, to carry, to possess,
not for USE in the U.S. This is legal and is why you can import them.

The law made the mistake of saying "manufacture or import for use..."
instead of "possession of" which is the reason the U.S. dealers will
pay the price of this stupidity. If they had tried for possession,
it would have gone no-where.

They saw no cause of concern at the time, maybe when their profits
dip - they will! Also I suspect they were looking at the world
market and not just U.S. -- meaning they know those of us who want
cellular will simply order a unit from a country which carries the
cellular models.

Hence, the basis for showing no problem getting cellular equipment.

Now about the discontinued. So far, the online system Radio Shack
stores use show it as an active item -- not discontinued.

6223. New model BC-855 XLT Mods?

Newsgroup: rec.radio.scanner
Date: 1994-07-11 19:19:33 UTC
From: jwilkers@news.delphi.com
Message-ID: <2vs605$7o5@news.delphi.com>
Source record: 271926

Ii understand that Uniden has redesigned the BC855XLT with a "booby trap" in the CPU to circumvent the 800 mhz mod as per the new law. I also understand the mods are more or less the same IF you circumvent the "trap" in the CPU.

Does anyone know this procedure? There are some that need to know how to do this, and those that do so far have been closed-mouthed.

Anyone?

|> Call. That should get you started.

For that matter, you can pick up a Police Call from anywhere
in New Jersey, Pennsylvania, and Delaware since those states
are included with Maryland. Of course, I find Monitor America
to be MUCH better. You just have to know where to look for
stuff.. christ, half of Maryland is stuck with the Wash D.C. area.

North Jersey precisely. Some areas of New Jersey, namely
Hunterdon County, are completely skipped by SMB (which
would be covered by four freqs and a table!) and you would
need Police Call to get anything in the area.

rm> Ipicked up a Pro2002 and a Pro2004,I was wondering if any one can
rm> tell me how to do a mod on the Pro-2004(cell phone) and if there are
rm> any quick mods for the Pro-2002?

Hi, Mike...
Coming to you from the 'burbs of Chicago. (Wheaton area)

No mods on the '2002 that I'm aware of.

Here is what I received for the 2004. It is not one I typed up, but it
is accurate.

** Disclaimer...Modification of receiver will void the warranty of your
unit. All modifications are done at your own risk.

** Monitoring of certain portions of the 800 Mhz band is prohibited by
United States law.

Take the radio out of the case by removing the 4 screws on the back. Carefully
invert the radio.

Locate a box-like sub-circuit. It's near the switch marked "restart". The
sub-circuit should be marked PC-3. Carefully pry off the cover of the metal
box. Inside there will be a 64 pin dip IC. This is the radio CPU. Be careful
not to touch or short out any leads on the chip.

The following diodes will determine how your scanner will work.

D-510 in circuit - scanner will have 400 memories (10 x 40)
removed - scanner will have 300 memories (10 x 30)

D-512 in circuit - it will step 30kHz from 825-844.995 and 870-889.995
removed - it will step 12.5kHz from 825-844.995 and 870-889.995

D-513 in circuit - will not scan 825-844.995 MHz or 870-889.995 MHz
removed - will scan all of 800 MHz band

D-514 in circuit - scanning rate increases to 20 channels per second
removed - scanning rate in 16 ch/sec (alt 8 ch/sec)

!!!! WATCH POLARITY !!!! If you cannot find a location, count backwards from a
known location.

Now, locate a sub-circuit box under the sloping front panel. It should have
many alignment holes in the top. Pry the cover off very carefully. Locate IC-2
in the left side of the pc board. It should be marked IC-10420. Locate R-148,
a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But

be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

Ok guys, whats the BEST make of radio for mobile scanner?

Must be:
1) Easy to operate one handed.
2) Continuous coverage.
3) Bank oriented.
4) Portable (of course).
5) Loud enough to hear over road noise.
6) Lighted display AND buttons!
7) HUD (heads up display would be nice) ;-)

Some brands and makes I use are: Icom R1, Icom R100 and RS 2026.

> There are also -voice- pagers which will let you actually speak
> into the phone and have it come out the person's pager. These
> are pretty rare.

As presented, this information is inaccurate. The next step after the one-way non-voice "beeper" was the voice pager. They are NOT rare at all, although they are decreasing in popularity as commercial or business paging units. They are still overwhelmingly popular in public safety use.

> The pager is a small sized radio receiver which constantly
> monitors a specific radio frequency dedicated to pager use.
> It remains silent until it 'hears' a specific ID string
> which tells it to, in effect, turn on, and then listen up for,
> and display, the forthcoming message.

This is just a bit incomplete. I don't know how involved you want to get. Recent pagers do not monitor constantly because it drains the batteries too fast. Instead, they "strobe" on and off looking for a preamble tone that (if correct) causes them to stay on long enough to catch the following specific tone or code combination. If the tone/code is correct, the pager activates. If not, it goes back to "sleep" for another few fractions of a second until the next strobe interval.

> Keep in mind that pagers work by constantly monitoring
> the radio channel for their capcode. So if you have
> ten pagers, or a hundred, or a thousand, all with the same
> capcode, they will -all- go off at the same time.

> This way the sports news company sends out one message
> and it gets displayed by all subscribers.

Those services are not exactly standard paging services. They are usually transmitted by subcarrier on a commercial FM broadcast station.

6232. 2006 picking up images from FM radios

Newsgroup: rec.radio.scanner
Date: 1994-07-11 23:09:46 UTC
From: copeland@metronet.com
Message-ID: <CsstoB.A0E@metronet.com>
Source record: 271933

I've noticed that my PRO-2006 picks up images from my SW and FM radios. When I turn the SW/FM radio off the signal goes away. I picked up FM on about 800mhz, and a SW station on about 400mhz. The FM radio was tuned to the station the scanner picked up, but oddly the SW station I picked up (netherlands) was not the station the SW radio was tuned!

Anyone else experience this?

>Buy it, then export the stuff you're interested in to the database of
>your choice.

Hi,

I purchased the Texas state CD ROM in April. If I want to update my CDROM
I have to purchase a new one. That's my one BIG BITCH. Many companies that
update their data on a quarterly basis have some type of upgrade path for
their customers. I'd be glad to send my CD back to be added to (it's a
Kodak Write Once CD) ~1/2 to 2/3's of it is unused. It should handle at
least one more write session.

The database engine is garbage. If you want to make it blow up enter a LAT/
LONG that is exactly the same as a data entry when you do a radius sort.
It blows up every time (divide by zero or floating point error). The ways
the program handles this and other errors (blows up) is pretty marks it
as kluge and not a real commercial product. I prefer to export my data and
use other REAL database programs to work with. It also works much better
if you copy the CDROM to your hard disk (yes, I have lots of space...).

Don't expect to legally make any money using this data. Even though they are
a designated distributor of data provided by taxpayer funding you have no
legal right to do anything with it. Since they are the only folks who sell
FCC data on CDROMs and the FCC designates them to do it it seem to me that
you should have some rights to the data for commercial use. Maybe I need to
buy the 9 track tapes from the FCC to do that. Any ideas folks? I want data
that I can legally resell.

It they had a realistic upgrade price and a better database engine it would
be a much better buy. On the other hand the quarterly versions are a much
better deal than the state version I was stuck with. Commercial use provisions
(even with fee's) would make it more attractive for business that need to resell
or include data for proposals, etc.

CUL and 73,
-barryc

Michael,

Have you seen the new frequency list for the South Coast? I uploaded it
to Santa Barbara City College's BBS a few days ago. Some 850 frequencies.

Did you actually see, or know of anyone that did decode the
'demo'conversation? When I was back in England, the local
Police force had a radio system that 'scrambled'the
conversation and sounded a bit like SSB but in fact was
something more complicated as there was more than one key to
decode the transmissions.

Just curious,

Bryan.

Hi,

I saw a press release in one of the UK mags, SW listener I think. Any way it sounded pretty impressive from that. I guess what i would like to see is a feature to set up a simplex pair, so that it will scan say 5 times between a pair of frequencies before moving on. This would be especially useful for some marine channels and I'm sure there are plenty of other simplex systems.

One other thing I would like to see is the ability to have a 'bank'and set it so that only one channel could be locked out. Mainly for trunked systems so that when the control channel changes, you just have to lock that one and not bother trying to find the the previous control chanel.

I would also be interested to know how easy it is to control from a PC, to interface with a PC for data transmissions, fax, weather, satellites, TV etc. Also in the same magazine was an article about new software for an AOR (3000??) where the reviewer set it up to search all day recording the frequencies and the conversations with a sound card so that he could all the communications on a specific frequency and determine it's use. Sounded pretty smart!

Thanks,

Bryan.

6240. Public Safety Trunking - why use it?

Newsgroup: rec.radio.scanner
Date: 1994-07-12 01:38:37 UTC
From: monty@pipeline.com
Message-ID: <2vss6t$5b3@pipe1.pipeline.com>

My mailer managed to lose the original thread but anyway, I just thought I'd give you my view of trunking in the town where I work.

Some years ago (before my time here), about 5 or so I guess, the Town of Colonie NY switched to a Mototrola trunked system. I believe there are 3 microwave repeaters in the town and I know that it uses 6 frequencies.

Some of the major benefits result from the statistics of use and how often people actually speak. In the fire dept, the radios are programmed with 4 specific fire channels and 1 town frequency. I know that both the EMS and the Police have at least 2 frequencies each, then there is the water dept, dpw, parks and recreation, animal control that I know of. Before the system each channel would have to be allocated a seperate frequency whereas now there are many channels but only 6 frequencies. In the fire dept I have not known of any time that all 6 channels have been in us, even when there have been seperate incidents on 4 of the fire chanels.

These systems also have the capability of being re-programmed on the fly so that water can communicate directly with fire and/or police etc. Each radio is uniquely identifiable and can be disabled/enabled at will. Traditional' frequencies can be patched in from surrounding towns/depts/counties as required. The system can be linked in to the public phone system and it can also be encrypted.

As for scanning, the system has been configured so that if the first frequency is not in use by the fire dept and a fire radio transmits it will be allocated that frequency. If dpw are using it they get bounced to another frequency. If two fire channels are in use, it wil still try to use the first frequency - unless it is already in use by a fire radio.

Finally, as far as encryption is conceerned, I can see why the police would prefer it. Why should you know where a speed trap is? Why should someone attempting to burgal a building know that the police are being dispatched? Why should you know the personal details of J Doe who has been stopped by the cops? I know from experience that the English Police think very highly of encryption as a tool in the fight on crime.

Just my opinion - Bryan.

: >the US. Most scanners that don't receive aircraft don't have an "AM"
: >position and aren't able to detect AM signals.

: Actually it would not be unusual at all. Most "FM" scanners do not have
: very much limiting in their receivers. Limiting is the function that reduces
: interference from AM signals and noise. An AM signal that doesn't get
: limited will be demodulated. Additionally, AM signals have some FM
: charcteristics as both generate sidbands (FM more than AM) which make the
: bandwith of the signal change in relation to the modulating (audio) frequency,
: though not in exactly the same way.

It surprised me though when it happened on my car radio. The radio station
normally at 98.7 MHz was off the air, and I could hear El Paso
International's ATIS broadcast (normally on 120.0 MHz) in its place.
My wife gave me a wierd look when I started screaming 'Images!! Images!!'
in the car. 21.3 / 2 = about 10.65, which sounds right for an IF.

From Jerry.Smith@f747.n115.z1.fidonet.org Wed Jun 15 22:43:15 CDT 1994
Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.

Hi Everybody!

I have a subject that I would like some feedback on. It is my understanding of the recently enacted rules covering scanners that although no newly manufactured scanner may be capable of, or may be easily modified to receive cellular transmissions, it IS still legal to sell kits that will modify a scanner to these abilities. I also understand that it is legal to sell a cellular capable scanner in kit form that a consumer can put together themselves. Am I correct in my understanding of these items? If so, where are these products? Why haven't the scanner makers jumped on this oppertunity? Any & all comments on this would be welcome.

Happy Scanning,

Phil Latimer

You should get ahold of The Scanner Mod Handbook 2...It tells how to increase the scanning speed, open the cellular band, and how to increase the channels to 3,200 (becuase of the original memory design).

Use one of those car casette CD adaptors (under $20) to get around the noise.
Cheap and very effective. Pro-43 users, adjust your equalizer to cut out that
bass "thump", and turn down the volume when you press a key (that 'beep' can
make your ears bleed!)

6250. Exactly where are cellular frequencies

Newsgroup: rec.radio.scanner
Date: 1994-07-12 11:48:13 UTC
From: w.mccall@csi.compuserve.com
Message-ID: <2vtvtt$4ok@mhaal.inhouse.compuserve.com>
Source record: 271951

I bought a new Pro43 and found out it is unmodifiable. I'm not self righteous, but I'm not sweating the loss of cellular, but if I did have it, I probably would scan it periodically. In scanning frequency ranges around 865mhz, I am picking up a lot of traffic that sure sounds like cellular traffic. Anyone have any idea what it is? I know its not police using phone lines to call home as I hear that on the local trunked system frequencies. In all cases this seems like private citizens talking and I can usually identify one of them as being mobile. Explanations?

6251. New Canadian Pro-43's modifiable?

Newsgroup: rec.radio.scanner
Date: 1994-07-12 11:57:32 UTC
From: sita@ecf.toronto.edu
Message-ID: <Cstt7x.J25@ecf.toronto.edu>
Source record: 271952

Does anyone have any information concerning the Pro43's available in Canada? The backs of the units do not have any FCC id #'s, just the following (for example):

20-300
DOC/MDC 255 B163
s/n: 084xxx

There are also small stickers on the back of the box (bottom right-hand corner) saying "3A4".

Any help is appreciated...

Andrew

I believe that is a correct interpretation. One selling a kit is
selling a bunch of parts and a schematic which doesn't appear to
be in violation of the new FCC regulations.

> It is also
>supposed to be legal to sell a cellular capable scanner in kit form that
>the buyer can assemble themselves. Am I correct in these matters? If so,
>where are these products?

Same asnwer as above. As to availability, that's a function of market
demand. For now I'd say no one has identified a big enough market
for such a kit. See more comments below.

> Why haven't the scanner makers jumped on this?

The complexity and packaging of today's scanners are faily well
beyond a home assembly level. Much of the assembly is highly
mechanized to eliminate quality defects, etc.
As above, I'd guess the scanner manufacturers don't want to
do so on general principle AND because they don't see a
big enough market for the kits.

>Any and all commments on this subject will be welcome.

What you will likely find marketable today is/are kits to build
broadband converters that take a range of input frequencies
(e.g. from 800MHz to 900MHz) and "convert" them to a lower frequency
rane (e.g. 400MHz to 500MHz) that most any scanner can already receive.
A broadband converter is far less complicated than a scanner and
it doesn't reguire programming channel selection and other scanning
features as those functions are done by the scanner into which
the output of the broadband converter is connected to.

I recall someone saying that a two part contruction article for such
a converter appeared in the Feb/Mar issue(s) of Radio Electronics
in 1993. I've never seen the article, but I'd like to get a copy of
it myself.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands. They are located at 9247 Glenwood Drive, |
LeRoy, NY 14482. |

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat |
scanners for several years. They charge a flat $45 repair |
rate for programmable and $30 for crystal scanners, and |
shipping is extra. Electronic Repair Centers will fix |
Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

6259. AR1000 audio problem

Newsgroup: rec.radio.scanner
Date: 1994-07-12 16:58:55 UTC
From: moninger@emiris.iaf.uiowa.edu
Message-ID: <2vui4f$cof@nexus.uiowa.edu>
Source record: 271960
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have an interesting problem with my AR1000. I am
experienced with scanning but am not up on my electronic theory.
So, I thought, write the experts.
I believe the problem might be with the headphone
jack/switch assembly, and it manifests itself in 2 ways;
1) when the headphone plug is removed, the scanner is
operating and a channel is active only staqtic is heard. The
speaker is silent when scanning, and
2) when the headphones are plugged in (I use the small RS
external speakerthat clips to shirt collars, etc.) and a channel
is active the speaker output is normal, with the exception that
any movement of the antenna or speaker cable introduces a hollow,
clunking sound to the output.
Any ideas? The speaker and antenna jacks are in close
proximity on this unit--loose wire, bad speaker cut-off switch?
Other then this small problem, I have been very pleased
with this scanner. I haved used it daily for two years and it
compliments my other scanners (BC210 and an Pro-2006) well.

>old stock rather than new?) Are they still current offerings from
>Bearcat?

These are both new offerings from Uniden. The BC 200XLT is a very good
scanner. The Ham Station has them on sale for $229. Major features are
100ch/sec scan and 300ch/sec search as well as a data skip feature to skip
over non-voice traffic.

I didn't say it needed to be designed that way; I said "it must be
able to receive AM". I chose my words carefully when I posted that,
especially such words as "able to receive" and "detect."

From what I understand 3A4 is the manufacture date. 3 is the month, in
this case March, and the 4 is the year, 94 in this case. The A is just
something they put in. Since the law regarding Cellular took effect in
April it should be modifiable. That is if R/S makes the units the same
for the states as in Canada.

> - Minh -

There are several good paper publications for the Los Angeles area. Technically, a dump of the FCC records (such as the PerCon CD-ROM or the Grove floppy-based database) could be considered an`electronic' list.

IHMO, all L.A. scanner enthusiasts should come at least once to the West L.A. chapter of the RCMA. It meets on the second Wed. of every month at 7pm at the Acapulco Restaurant by the Santa Monica airport.

IHMO (again), the best available electonic list is on the CPRA (California Public Radio Association) BBS (+1 714 704 7903). An alternate BBS for the CPRA frequency list is the CIA BBS (+1 619 273 6339). The CPRA is really the group that does most of the hard work (and hard work it is) of local coordination of public safety frequencies in the So. Cal. area. CPRA frequency allocations form the basis for most of the information in most of the local paper-based publications, such as the So. Cal. edition of Police Call.

As an interesting aside, I have had several (heated) discussions with Gene Hughes (sic) over whether or not PL's should be published. Gene does not publish them. Interestingly, a new publication, "Police and Fire Communications Handbook" by ArtSci (+1 818 843 4080) does publish PL's. The PL's are useful, primarily because of the amount of interference (and there is a lot of that in L.A.) that is reduced.

Enjoy the hobby (while we still have one),

Wayne

There is the Radio Shack PRO-2006 with the OptoElectronics, OS-456, interface add-on for around $750 total. I just received my OS-456 yesterday (Monday) and it gives me a lot of features that are not included in ANY other radio without expensive add-ons. Such as CTCSS and DCS squelch control and DTMF decoding. RS-232 serial, and a CI-V input for connecting icom radios to the same interface. (You still need an external CI-V interface to the computer.) Unfortunately you lose the carrier detect feature if you go with CI-V, and that slows down the SoftWare. Plus unattended Search and store with virtually unlimited storage capabilities and unlimited banks and channels in any configuration you want, but those are standard fair with any computer controlled radio.

The only problem with this setup is that you don't look at your radio anymore, you stare at the computer screen. This takes scanning out of the realm of radios, and into that of computers that can receive radio signals. The software becomes everything, and the current state of the art in scanning control S/W is still fairly primitive. Read not very good. The new Opto 456 adds a whole slew of new features in one integrated package, so A LOT of work is needed for the S/W to catch up. The current S/W is modified from existing radio control programs that don't have the features that the OS456 provides, but they are working on it. Almost everything in the 2006 is controllable via S/W now, except the volume control. The speaker can even be turned on and off by the S/W. This leads to all sorts of possibilities, if there were S/W that supported all of these features completely.

I'll post more info on this subject as I use, and learn more about, my new toy.

PRO-2006 $369 US from Grove, there are cheaper places to buy from.
OS-456 $299 US from OptoElectronics.

S/W ~$ 80 US from any of several software dealers like Scanstar.
Total $748 Plus any taxes and shipping charges.

A little more than medium priced but an unprecidented value.

Good listening

6281. Freq Doubler

Newsgroup: rec.radio.scanner
Date: 1994-07-13 02:35:50 UTC
From: ddetardo@freenet3.scri.fsu.edu
Message-ID: <2vvju6$kn5@freenet3.scri.fsu.edu>
Source record: 271834

Does anyone know if frequency doubler/or reducers are still available
to allow 400mhz scanner to receive 800mhz? If so where and how much?
Are they any good?

I'm sure you meant to say that the outputs are from 869.040 - 893.970MHz
(30kHz spacing), with the inputs 45MHz down.

: relayed a story here about that a couple of months ago.)
: The radios they have to communicate with the board also doubles as an
: intercom system with other employees. This is where the fun is. <g>

A friend of mine and I have come up with an idea that would put these freqs to good use. We're going to take my portable scanner, and hook one of those car portable CD converters(You know, the cassette tapes that have a headphone wire comming out for an input device) up to it. Then, when we get to the drive thru intercom, we're going to set the scanner to the right freq, and blast the stereo. That way it should(in theory) create a big amount of feedback to the person taking the orders(something they usually give to the customers). It'll also be funny just to blast the orders while sitting in the parking lot. So much for privacy.

We're going to try both of these things tomorrow. Anyone want to speculate on what'll happen????

Feedback == transmitting???

I think not. It'll just annoy the hell out of everyone wearing headsets in
the store and yes, it will work.

> The radios they have to communicate with the board also doubles as an
>intercom system with other employees. This is where the fun is. <g>
^^^^^^^^^^^^^^^^^^^^^^^^^

Indeed. Take this fine example:

A friend of mine (we'll call him "Bob") and I went drove through this McDonalds that he used to work at and were listening to the in-house chat frequency for this particular store. While were waiting to order we heard a couple of the managers (one male, one female) joking around with each and the male manager mentioned that he thought the female manager had nice breasts. We got a good laugh out of that one, especially since we knew the male manager was married. :)

I was driving, but when it came time to order, Bob leaned over and ordered a strawberry shake in a rather raspy fake voice. We were told to "pull ahead", so we did. There were a couple cars ahead of us and as we were waiting we heard the following:

MM==Male manager
FM==Female manager

MM> "Was that Bob?"
FM> "Ya, I think so. What did he order?"

MM> "A strawberry shake. Should I spit in it?"

When we got up to the window, the male manager handed me the shake. I took it, looked at it suspiciously and said "You didn't spit in this, did you?" Talk about taken by surprise! 8D He replied "No." in a kind of slow, surprised voice. Bob and I laughed to ourselves while the manager was making change. When he handed me my change and said "Thanks." I replied: "Oh, by the way: I think she's got nice breasts too." He replied with a rather odd, and confused look on his face "Oh, ya' do, huh?"; we drove off. I doubt he made any further comments for at least the rest of the evening. :)

Another time a friend of mine and I drove through a McDonalds while I was monitoring their in-house chat frequency with my W2A. We ordered, received change, and pulled forward to wait. The person taking the money at the Drive-Thru window must have noticed my handheld and assumed (good assumption) I was monitoring them becayuse after a couple minutes he said "You guys will have to move up further." Needless to say we were amused.

The real reason that the cellular companies don't like to put two phones on the same number is because then they can't charge you for two contracts, two startup fees, and two monthly base fees. The lines they give out like "this policy is for your protection" or "we have trouble routing the call to two phones" is pure, 100%, undiluted bullcrap. When ever I hear those two lines it makes me laugh almost as much as when I hear them say "cellular calls cannot be monitored in the United States."

I stay with the cellular carrier that I use mainly because when I bought my phone, and then asked about a second phone on the same number, the salesman had enough balls to tell me the REAL reason they didn't want to do it.

I've been picking up at 147.450 in the Washington D.C. are.
In New York, you might want to try around 146.820.
I got these off of a frequency list that someone posted
back in April.

I was wondering since one can pickup TV audio on a scanner; can one pickup satellite audio frequency for EX. HBO, MTV, ETC. Bare with me folks, I'm some what a novice at this. I'm thinking, if the scanner was in the frequency range, you would need an amplifier similar to ones in the middle of the satellite dish. Thanks..

The one scanner that all of you have forgotten is the Kenwood RZ-1. It is 100 channel;500-1300 mhz;10 banks; and has alpha-numberic display. It is not as fast as some of the newer scanners but it is triple conversion and really reliable for either base or mobile. I have had 2 of them going for over 5 yrs (24 hrs a day) and has just had them both checked and some bulbs changed for about $50/ each. They are usually found in HAM radio stores and I have neer been able to find any used ones for sale. If anyone has one for sale, let me know.

6298. Hillsboro Airshow

Newsgroup: rec.radio.scanner
Date: 1994-07-13 15:10:29 UTC
From: mjohnson@wv.mentorg.com
Message-ID: <301055$cef@hpcan240.mentorg.com>
Source record: 271860

I'm looking for frequencies that will be in use during the
Hillsboro, Oregon airshow this coming weekend.

The headline act is the Air Force Thunderbirds. Anyone
scanned them recently at another airshow?

Also, there will be various miliary fly-bys. I think I have
Hillsboro tower civilian and military frequencies, but approach
and departure are handled by Portland, OR, international airport (PDX).
Which civilian and military frequencies of PDX are used for
Hillsboro approach/departure, since PDX has several sets?

As a last question, I can hear the Oregon Air National Guard F15s
talking to PDX approach/tower occasionally,and once in awhile talking
to Portland Airbase, but what frequencies do they use for plane to plane?

Please reply via e-mail.

Thanks!

Regards, Mark.

>Are they any good?
>

I bought a GRE Super Converter thru Grove Enterprises for about $90. It is powered by a 9 volt battery or an ac adapter. When turned on, it converts what you program in your scanner up 400 mhz. The only drawback is that the cell band has a frequency spacing of 30 khz and the converter doesn't have any affect on the frequency stepping of your scanner. If you have a scanner the allows you to pick the step rate, you could select a 5 khz step to allow getting all of the cellular freqs.

Sometimes in small towns, there isn't much going on on the police/fire
bands. Also, in some areas, police use cellulars. You can hear them
call the families of the kids they pick up, etc.

6303. Uniden repair time

Newsgroup: rec.radio.scanner
Date: 1994-07-13 16:26:34 UTC
From: geiste@hsi.com
Message-ID: <Csw0CB.LIy@hsi.com>
Source record: 271848

I just sent my BC70xlt to Uniden for repair. Does anyone know how long
it typically takes before I can expect it back?

Thanks

> I'm sure you meant to say that the outputs are from 869.040 - 893.970MHz
>(30kHz spacing), with the inputs 45MHz down.

Are the cellular data/paging frequencies constant? If I put in only the
active frequencies in my scanner and left out the data ones, would this
work indefinately (at least until more frequencies were used)?

Did you try the front panel reset button, that should put it into the
default step size, which if the radio is still restored is 30KHz.
If the diode is re-connected after you program in those freqs, the
30KHz step size will no longer be available but the freq was already
entered so it is still valid. Try seperating the clipped ends of the
diode, they are probably connected because they weren't seperated enough.

Source record: 271857

Does anyone happen to know the frequencies of the Gainesville, FL regional transit system? I'd like to listen in, but I concede that the frequencies for that area might be a little obscure. Does anybody know then any frequencies for buses in general? I know that police freqs for instance tend to cluster around several places, and perhaps bus freqs do too. If you know of any bus freqs, please send them to me or post them here. Thanks in advance!

Voltaire

ARE YOU SURE?!

The GRE has it's own ideas about WHEN it starts the 30KHz spacing. Watch
carefully, The radio will start to step properly above 870, but you will
not see the "step" indicator change.

The data frequencies are not constant. I heard (and listening
seems to confirm) that they do jump around, to even out the
wear on the equipment, perhaps since a data channel is constantly
transmitting where all the others are intermittent. I have heard
where the data channels change frequency about twice a day, and
keep rotating.

Try to think of them as talkgroups or modes as the suppliers call them.
There is not a frequency assigned to each service, but a "virtual" or "soft
channel.

When the excrement impacts the ventilation system, the departments will
be surprised to find that only four conversations can go on at once!
(assuming 4 voice/1 data pairs)

<...>

>These systems also have the capability of being re-programmed
>on the fly so that water can communicate directly with fire

Does your department actually do this? Cool. None of the trunk systems
I have monitored have done this. They usually wimp out and have a common
group for all services.

<...>

>Finally, as far as encryption is conceerned, I can see why the
>police would prefer it. Why should you know where a speed trap
>is? Why should someone attempting to burgal a building know

Criminals of this type are usually too stupid to use a scanner. That's
why their criminals.

>that the police are being dispatched? Why should you know the
>personal details of J Doe who has been stopped by the cops? I

The M400 is a great decoder for lots of digital formats and the
price is reasonable. My problem is the NO UPGRADE policy for the M400!!
If you are talking to Universal, or your favorite dealer, bitch about
the lack of upgrades. The reason why I am upset is my M400 will decode
512bps POCSAG but not the newer 1200 and 2400 POCSAG and will not upgrade...

|> Oh, yeah, dont' forget about txing on McD freqs with
|> a non-type-accepted radio.

It didn't seem so stupid when I did it as it does in print.

I have a loudspeaker mounted at my feet, so audio is no
problem in my car. I pulled up, blasted it and the feedback
was actually pretty funny to listen to.

The order taker screamed on the private channel "WHAT IS THAT
NOISE??!!!" The only "tx'ing" going on is in the human audible
range, and that is NOT RF. An unmodded scanner does not
transmit (except for leakage of course and that's hardly
lawsuit material).

In fact, their microphone is sucking in your personal audio
from your car, causing problems for themselves. What they
do with the audible sound coming from my car is their business..
they own and are operating the transmitter.

Source record: 271780

-=> Quoting Jim Kurdzo to All <=-

JK> I know this came up recently, but I missed it. Please tell me where I
JK> can find mods for the PRO-2032.
JK>

Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

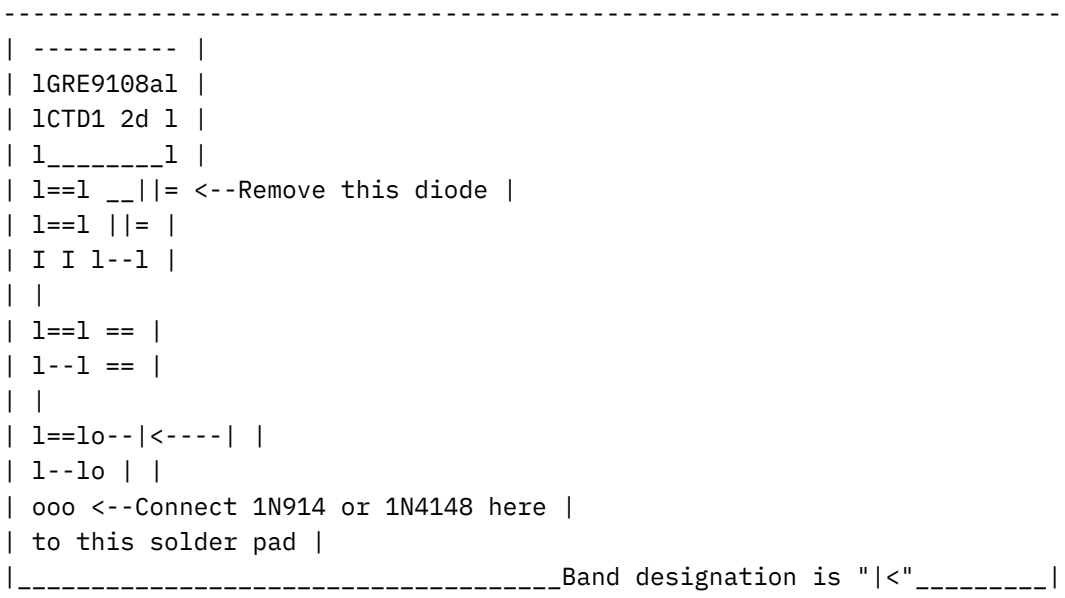
** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.
** READ THIS!! **

** Note...many Pro series scanners are being changed to make them
unmodifiable. For example, the '43 has an 'A' before the serial number and
a new FCC ID number. If your unit was manufactured after April, 1994
(designated by a sticker on the back showing 5A4 or above) or there is
an 'A' before the serial number, your unit may not be modifiable.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.

6. If successful, unplug the unit and reassemble the scanner.



6320. Re: New Canadian Pro-43's modifiable?

-=> Quoting SIT ANDREW to All <=-

SA> Does anyone have any information concerning the Pro43's available in
SA> Canada? The backs of the units do not have any FCC id #'s, just the
SA> following (for example):
SA>
SA> 20-300
SA> DOC/MDC 255 B163
SA> s/n: 084xxx
SA>
SA> There are also small stickers on the back of the box (bottom
SA> right-hand corner) saying "3A4".
SA>

Hi, Andrew...
Don't think I can help too much. "3A4" is the date of manufacture.
Hence, the units that yow saw were manufactured March of 1994. This would
make the '43's you saw capable of receiving cellular after the mods are
completed.

Don't know if any units manufactured after April will still have the
same design. Could you do me a favor? See if you can find any units
manufactured "5A4", or May of 1994. Check the sticker to see if anything
has changed. I know reports have come up here in the States that the FCC
ID changed and the serial number starts with the letter A. Don't know if
this will happen with Canadian units.

Thanx...Jerry

Thanks.
>
>Jim

I have owned both units and in my opinon the PRO-39 blows chunks when
compared with the BC200-XLT. I was a total idiot when I sold my Bearcat!
The only reason I have the PRO-39 is that I picked it up used for
$100.00. Here is my Good/Bad list:

Good points about BC200-XLT
1. RUGGED!
2. Leather-like case included.
3. A.C. Adapter included/Earphone included.
4. One of the easiest cell mods (No desoldering/soldering needed).
5. Will display what channel a freq is in if entered again (Really
Cool!).
6. Big display/Good light.
7. Car adapter available.
8. Good speaker/tone.
9. Very easy to program freq's. (Manual, Channel #, Manual, Freq,
Enter.)
10. Much better search and hold function, with the ability to enter the
freq into any
channel while searching.
11. Available for $159.95 from Damark. (Call them up at 1-800-788-7202)

Bad points about BC200-XLT
1. Proprietary NiCad battery pack.

Good points about PRO-39
1. Standard AA cells battery pack.
2. Ability to go to NiCads.
3. A little bit smaller/lighter
4. Direct search function. (Go to a freq and then press up or down keys
to search).
5. Scans faster, 25-vs-16 channels per second BUT, will scan zeroed
channels if not
locked out! (Kinda negates the whole HYPERSCAN thing.)

Bad points about PRO-39
1. BAD Intermod!
2. Small display/Weak light.
3. STUPID search and enter function. (You must enter the freq into the

Monitor area
first, a non-scannable ten channel area, and then into the
scannable channel of your
choice).
4. No adapter!
5. No case! (None available, only a pouch).
6. Small buttons.
7. You have to desolder/solder for cell mods.
8. Weak antenna mount.
9. No hold function during search.
10 $299.99 List! (Probably can be found cheaper, but not by much.)

I hope this helps, as you can see I favor the BearCat over the PRO-39, it is a far superior product for the money! Please, no flames it is only an opinion!

: |> for transmitting on their frequencies?
: |> Oh, yeah, dont' forget about txing on McD freqs with
: |> a non-type-accepted radio.

: It didn't seem so stupid when I did it as it does in print.

: I have a loudspeaker mounted at my feet, so audio is no
: problem in my car. I pulled up, blasted it and the feedback
: was actually pretty funny to listen to.

: The order taker screamed on the private channel "WHAT IS THAT
: NOISE??!!!" The only "tx'ing" going on is in the human audible
: range, and that is NOT RF. An unmodded scanner does not
: transmit (except for leakage of course and that's hardly
: lawsuit material).

: In fact, their microphone is sucking in your personal audio
: from your car, causing problems for themselves. What they
: do with the audible sound coming from my car is their business..
: they own and are operating the transmitter.
: --

I'm glad not everyone who reads alt.scanners is a play by the
rules lawyer who's never played a prank in his life. The whole point of
the post was to tell the world an idea I had as to what to use the freqs

for. If you don't like the idea, then fine, but why do you have to try to make me look bad by saying people will sue me. It's obvious the 5 teenage brats working at McDonalds aren't going to bother to take me to court. As for the FCC, it was kindly explained above that I'm not actually transmitting the signal, just using the speakers of my car to listen to my scanner(which as of yesterday was legal).

So hopefuly all of you don't only think of things from a legal standpoint, and possibly some of you may have gotten a laugh out of my idea.

-Jay

6326. Opinions on 900MHZ cordless phones wanted

Newsgroup: rec.radio.scanner
Date: 1994-07-14 03:39:56 UTC
From: cardinal@bu.edu
Message-ID: <302c2c$ec1@news.bu.edu>
Source record: 271777

I'm currently on the market for a 900 meg cordless phone. I'd like to know wants out there and what people think the best ones are. The two features that are most important to me are range and sound quality. Two line capablity might be nice, but it's not a real big deal. Any help will be greatly appriciated.

Matt

6328. Silent Play 270-1715

Newsgroup: rec.radio.scanner
Date: 1994-07-14 04:15:40 UTC
From: bambrosi@sdcc13.ucsd.edu
Message-ID: <70311@sdcc12.ucsd.edu>
Source record: 271779

I was wondering if it were illegal to use the silent play on a scanner. Is it considered rebroadcasting? Or is the power too low to be considered rebroadcasting. I think read something about this is the CB rule book i got with my CB. Not sure. I am thinking about getting Silent Play but I want to make sure everything is legal.

I think it would work great when working around people that you don't want them to know you are using a scanner. All they would see is the walkman radio or whatever.

Because it's there, or not there. You have a scanner with frequency chunks missing and so you either dig up the mods for the model, or figure them out. Then you take the plunge and void your warranty and listen for all of twenty minutes or so to boring cellular conversation. Whoop-de-do.

People with cellular phones know that their conversations are not private, alter all they are usually driving around. Now cordless phones are more interesting. These you can listen to for a full thirty minutes before you O.D.

And yes the PD, FD, and other emergency traffic is much more interesting. I enjoy knowing what is happening in the city (San Francisco) that never hits the newspapers, which can get rather amazing. But monitoring phone calls, bleah. You'll get over it.

POCSAG... That's what digital pagers talk, right? Is there anyone
out there who has the specs on this? Could they actually be found on the
net? So much cool digital decoding can be done with a sound card, even if
not in real-time...

: Hi Everybody!
:
: I have a subject that I would like some feedback on. It is my
: understanding of the recently enacted rules covering scanners that
: although no newly manufactured scanner may be capable of, or may be
: easily modified to receive cellular transmissions, it IS still legal to
: sell kits that will modify a scanner to these abilities. I also
: understand that it is legal to sell a cellular capable scanner in kit
: form that a consumer can put together themselves. Am I correct in my
: understanding of these items? If so, where are these products? Why
: haven't the scanner makers jumped on this oppertunity? Any & all comments
: on this would be welcome.

No. You should be able to purchase repair parts, to repair a scanner that
already receives the cellular frequencies.

However, modification kits are now illegal - as are frequency converters.
Both are covered by the ECPA.

I don't know if scanner kits have to be type accepted, or not. If they do,
then you will not be able to legally buy one that can easily be modified to
receive cellular transmissions.

It's called "harmful interference", and since it's willful, the persons
doing it are liable for civil and criminal lawsuits.

For the sake of those who would scream "Oh, it's not a big deal",
I'd love to see anyone do this to a cop while he's transmitting.
Ask him if he thinks it's cute, his 50 thinks it's cute, and
the FCC would think it's cute.

McDonalds may be a rather sad example of commercial radio, but they
do have rights. So, tread lightly, if at all.

I recently met a fellow monitor who had built a kit called "The Poor Man's Spectrum Analyzer". After seeing it in operation I thought it could be a useful addition to my own shack. The only problem is that the kit was in the region of 4-6 years old and was bought in the states. Can someone please advise me if it is still possible to obtain this item. The address that came on the original package was as follows:

Science Workshop
Box 310
Bethpage
NY
11714

Is this address still valid, has anyone else used this piece of kit, any help will be much appreciated.

Thanks in advance.....

The latest "73 Magazine" has an ad for this scanner, which looks to be an AOR AR-1000 clone. The advertisement by ACE states that the cellular frequencies have been locked out, so the question is:

(1) Is it actually identical to the AR-1000?

(2) Can the cellular frequencies be reprogrammed into the EEPROM via the method shown in Bornestein's "Guide to the AR-1000?"

[Perhaps someone with Bornestein's e-mail address could ask him about these newly imported units?]

jason.al-shawy@ectech.com (Jason Al-shawy) writes:

>I was wondering since one can pickup TV audio on a scanner; can one
>pickup satellite audio frequency for EX. HBO, MTV, ETC. Bare with me
>folks, I'm some what a novice at this. I'm thinking, if the scanner was
>in the frequency range, you would need an amplifier similar to ones in
>the middle of the satellite dish. Thanks..

Sorry, Jason, there are several problems with this. The most
insurmountable problem is that audio for cable channels such
as you mention are D.E.S. encrypted in the videocipher II+
scrambling system. There are a few cable type channels in the
clear but they certainly aren't the likes of HBO and MTV. More
like C-Span and The Learning Channel.

The other problem is that the signal is so weak as it comes from
the satellite that it needs to be focused and amplified before it
becomes usable. Thus the familliar satellite dish and lnb.

I am a satellite tv/audio enthusiast as well as a scanner hobbiest.
I can assure you that should you ever get into the satellite hobby
there are easily hundreds, more likely a magnitude of thousands, of
radio stations of all kinds to listen to, both foreign and domestic,
as well as VERY interesting video.

Picture this: An inhouse point-point teleconference. The cameraman
(your point of view) is walking down the hall following someone.
'Follows him right into the bathroom as he walks up to the urinal.
Tinkle tinkle. Flush. He turns around, sees the cameraman and
let's loose *&^%&!!!. Cameraman starts laughing hysterically and
barely manages to get out "Chill out, it was just a joke, see the
camera's off...OMIGOD! Dark screen...

I know the above paragraph is slightly off topic but I thought
scanner enthusiast might enjoy it and show that you can also
"scan" video channels, after a fashion.

I would be interested in what others have to say about this also.

IMO, since the Silent Play qualifies under the FCC rules as it
does (low-power personal), then it should NOT be illegal to use
for scanners. I use mine frequently in that fashion.

I WOULD, however, take measures NOT to retransmit anything that
was illegal to listen to in the first place (e.g. cellular).

Sometimes I listen to my scanner at work while its running at home.
I've got a answering machine that has a room monitor mode. After it
answers, I punch in the secret code, and I can hear whatever is going
on. I leave the scanner running right next to the answering machine.
At work I have speakerphone so I can listen without the handset.

>on the 450-452 Mhz band. You'll also find the rush hour traffic reporters
>in their aircraft their. I listen to them regularly on my scanner for
>continuous traffic info...

You can quickly learn a couple of amusing things about traffic
reporters (here in the San Francisco Bay area, anyway):

1. Those "live, up-to-the-minute" traffic reports are actually taped.
The reporter calls in: "Here comes my report. 3 - 2 - 1. Traffic on
southbound 101 backed up at Lawrence Expressway [etc., etc.] Back to
you, Mike." This report is recorded by the studio and broadcast
during the next traffic report, as much as a half hour later.

2. Some reporters serve multiple radio stations. You can hear a
reporter give essentially the same report several times, but with
different endings: "Back to you, Mike", "Back to you, Joe", etc.
Sometimes the reporter varies the presentation for different stations.
And some reporters adopt an entirely different style of speaking when
giving a report than when talking at other times.

>No. You should be able to purchase repair parts, to repair a scanner that
>already receives the cellular frequencies.
>
>However, modification kits are now illegal - as are frequency converters.
>Both are covered by the ECPA.

I've read the rules and the sale of KITS (i.e. a box of parts and how
to instructions) doesn't appear to be prohibited. Already built
converters are prohibited, but not kits. If some electronic honbby
magazine decided to publish a "How to build a converter" article
and included a parts listing, that'd not violate any law. If someone
else then sold all the parts as a package, that'd not violate anything
either.

>I don't know if scanner kits have to be type accepted, or not.

Kits do not need to be type accepted because they are not finished
products. One is only selling a package of parts. Nothing
you build yourself for your own use needs to be type accepted.
If that was the case, then all those parts vendors who supply
package deals for various kit projects published in hobby magazines
would be violating the law.

> If they do,
>then you will not be able to legally buy one that can easily be modified to
>receive cellular transmissions.

See above.

Also the reason type acceptance wouldn't even be granted to a kit
(if someone tried to get type acceptance for their kit) is that
each kit could be assembled with enough variety (wire lengths,
sloppy solder joints, etc.) that there's no way for any kit
seller to assure that the build kit would still pass type
acceptance.

I recently bought a new Pro-43 that as of yet, can't be modified. I'm not overly concerned as I have lots to listen to in my area. But I have been getting what has been explained as image signals in the 865mhz area. Last night, I overheard two teenage girls talking about their recent tattoos, one of which was a snake on her genitals. I was, shocked, amused, bewildered, and repulsed, but boy was I entertained! 99% of the time you hear junk, but once it a while it sure can be interesting.

Bill

6362. Clarification on which Pro-43s are modifiable

>You refer to the 2006A. Are we to take this as proof that the 2006A is,
>in fact, um, "upgradeable to full 800 MHz coverage"?

The 2006A has an on/off switch for the backlight in the display. The 2006 has a dimmer control. That's the ONLY main difference that I'm aware of.
>
>If so, is the same true for the so-called 43A?

Echo answereth not--don't have one (yet)

BTW, my 2006A is modifiable (I looked), but I haven't bothered.

I guess I'm enough of an anarchist to want to own 800 MHz coverage, too lazy to be bothered listening to the drivel that passes for cell-phone conversations around here.

"Dear, bring home a gallon of milk, please!"

I Get enough of that on the 147.240 repeater phonepatches.

Source record: 271820

Well, while we are all talking about helicopters:

I've been trying to get some contact with from Stanford's
Life Flight helo. It flies over my house often enough,
I better be able to scan them...

Just wondering if any one knows the usual procedures
used with things like Life Flight. When do they talk
to dispatchers, people at the LZ, destination hospitals,
etc. And how much of this is done on landline before/
after flight?

And on related note, what about police helos. Do they
usually use the same tactical freq's as the ground units
for air-ground, or are there special freq's set aside?

Thanks!

Who said they were live? I never recall hearing any station or traffic reporter say their reports were live. I know for a fact that a couple stations tape theirs because they fall at clock times which coincide with those at other stations. They're not very stale, though, maybe 10 minutes.

: >2. Some reporters serve multiple radio stations.

Most of them do. They use different names, too. This is not a big secret.

: >Sometimes the reporter varies the presentation for different stations.

Yeah, apparently smooth-talking Bob Thorn(e) from KGO is somebody wild and crazy on KYLD.

Remember: radio is *theatre* of the mind. Likewise, there is no Purple Grotteaux, the EIB Network doesn't exist, the Lone Ranger tamed the West in a radio studio, Mancow was not a cow (and barely old enough to be a man), and the stealth copter was a sound effects record.

WCBS in New York is very much live. Philadelphia is taped as you say, but I tested CBS-NY the day I moved there. If you're a serious commuter, you can stick 450.850 in one of your scanner's channels and get a traffic report "every 10 minutes on the eights!" during rush hours. :) Of course, NYPD xmits so much on some channels, the repeater barely gets to take a breath, so you may miss some of the reports if you have a busy channel being scanned.

```

That was very true in Philadelphia. It was funny hearing the same person sign off with so many different sets of callsigns.

Since I commute from Jersey now, I listen to the suburban operations of Shadow Traffic on 453.000. These are updates that are not taped for broadcast (and are certainly not live), hence these transmissions are legal for monitoring under the ECPA, unlike the taped (or live) transmissions discussed above.

Maybe someone should put together "The Commuter's Guide to Scanning", showing how to stay on top of everything from the trains to the highways and buses.

: >--
Hey,

I feel I must put in my 2 cents here since I did work at Metro Traffic Control Inc., the company that does the traffic reports for dozens of radio stations around the country, several of which are in the Bay Area.

1. Traffic Reports are NOT taped, except in extreme cases where a reporter cannot make a live broadcast. When they are taped, the tape is broadcast NEVER more than a minute or two later.

2. Yes, traffic reporters sometimes broadcast for more than one station. I can't recall any reporter using the same "stage name" for more than one station. Actually, I can think of two off the top of my head. Joe McConnell does reports for KGO-TV as well as 104.5 KFOG. Sal Castenata does reports for KTVU-TV as well as KITS 105.3. Radio stations tend not to like having their reporters share time with other stations, so this is not a widespread thing.

3. Yes, reporters do broadcast from real flying helicoptors or planes. They don't make the sound all staticky for entertainment.

4. The reason why reports tend to be "stale" is due to the programming of the radio station. The live reporters make a list of all the active events going on the highway network. They obviously can't be everywhere at every second (the Bay Area is pretty big, it takes a good half hour or more to fly from San Jose to Vallejo, for example), so they also try to

get information from CHP, the bridge authorities, cellular callers, and police scanners to come up with an accurate list. They use the most current list they have at the time the radio station wants them to broadcast a report. Yes, sometimes events may be several minutes old when they are broadcast.

I'm the first to admit that the reports are not the most comprehensive or "up to the second" as possible, but they are evidently accurate enough for many radio stations to hire their services.

Any questions, comments?

SethBY

Help wanted
In the June issue of Monitoring Times John Catalano reviewed a Shareware
progam called WORLD 29.It is available on Amsofts World Of Ham Radio CD-ROM
Can anyone tell me if it can be got via the Internet either by FTP or Telnet?
For anyone who does not read Monitoring Times, this program plots the
position of aircraft on a World Map. Any replies either to this Newsgroup
or directly to alfie@portrush.demon.co.uk

6372. Mods for Uniden BC 855 XLT?

Newsgroup: rec.radio.scanner
Date: 1994-07-14 21:36:34 UTC
From: stoll@hypnos.norden1.com
Message-ID: <304b52$611@ns.oar.net>
Source record: 271823

Does anyone know of any modifications for the bc 855 xlt? Specifically
I would like to recceive the military air band which is "not supported
by my unit". I realize that this is a fairly simple receiver, but I have hope
that the one big IC does not control all frequencies.
Thanks,
Brian

Hi,

the title sais it all but once more: I need a list of HF RTTY (or simmilar)
frequencies, on wich one could receive REUTER's news bulletins.

I've seen some press agencies on HF, but never Reuter - and I've heard that
they still use HF.

> |> >
> |> > <snip-o-rama>
>
> |> Tom,

I went to my local Radio shack Saturday, and while I was there I asked
to take a look at the *NEW* PRO-2006 scanner they had on the shelf.
Well the sign under it said "NEW". When I looked closely at it I
realized that not only was it NOT new but it wasn't even a 2006A. It
was an older 2006, because the display backlight switch still said
"Dimmer" instead of "Display" and the model # on the back was 20-145
and not 20-145A. The "A" model has been out for 2 years now, so this
NEW radio HAD to be more than 2 years old. I guess they don't sell
very well here in San Jose. The upshot of this is, just because Tandy
sent them a sign that says "*NEW*" for the PRO-2006 they put it on the
display hoping to sell it. So check the model number on the back first.
As far as I know, nobody has reported *actually* seeing a new non-
restorable PRO-2006B for sale in a store, only a sign that says *NEW*
on the existing stock.

Good scannin' to ya.

>in their aircraft their. I listen to them regularly on my scanner for
>continuous traffic info...

Several radio stations around here use cell phones for their live remotes
instead of their 45x radios or their 165-175 Mhz radios (used to dispatch
reporters, etc.) Using cell phones has to be cheaper than maintaining other
transmitters, radios, renewing FCC licenses, etc.

I also heard that it was against the law to listen to these 450x frequencies
that radio and TV stations use for remotes, traffic reports, etc.

Can anyone verify this? (I think I read about it in Police Call.)

6376. Is my PRO-31 useless?

: What is the big attraction on the cellular channels?

Listening to the cellular channels certainly *is* boring as hell, but it is certainly helpful and interesting in certain situations to have the capability. Now I would never do such a thing, since it's illegal, but a friend of mine who listens to cellular from time to time has picked up a few 911 calls to the P.D. that people were making from their cell phones. He was then able to track the P.D. response to those calls from the beginning. It's also handy to have cellular capability when there is a P.D. situation going on. In addition to monitoring the P.D. tactical frequency, he has been able to monitor cell calls made from P.D. command posts during various hostage or similar situations.

I've heard one traffic helicopter reporter in my area giving "exclusive" traffic reports for several area stations! 450-451 & 455-456 MHz are good places to listen for such reports.

I thought the model number was still PRO-2006 in both cases; only the
catalog number changed to 20-145A when the dimmer switch was changed to
an on/off switch.

How would it not be the same, concerning radio frequencies?
Is it because one is a "necessary" service and the other is not?

I'd also like a listing of all the lawsuits versus McD's, please.

Asking anyone to committ willful interference of a frequency
(why, it's even illegal to do it on CB frequencies) is nowhere
near mature.

Regardless of whether or not you like/dislike McD's, their service,
vigilante revenge via a radio is no way to get even.

You're right, it's easy to refer to talkgroups/channels as
frequencies, which of course they aren't. Sorry to add to the
confusion.

Yes and no. The system is prioritzied so that Police and Fire
have the two highest priorities. The town _tries_ to educate
users about the meaning of different tones and available
channels/talkgroups. Personally, I've not known this to happen
... yet.

SOME reports are pre-taped, but most of them ARE live. The only time they get taped are when a reporter needs to be on multiple stations at once.

True. We call those different endings "lock-outs." Yes, we also DO vary our delivery to fit whatever station we're on.

That's interesting. What is his rationale? My next book will include
CTCSS tones and DCS codes where I have been able to determine what they are.
I don't see a problem with that. It's too easy nowadays to obtain or build
equipment that displays the tones/codes in use anyway. They aren't a big
secret any more.

I'm doing some tinkering with my Pro-2004 in hopes of doing some remote control of it. Looking at the keypad interface, it's connected to the main CPU board by a 13-conductor header. I assume the keypad is wired as a 6x5 switch matrix with the other two leads being grounds... has anybody else tinkered with the keypad? Or even better, are schematics available for this scanner anyplace?

Brett:
There are several decent programs to run the AOR-3000A.
The one I prefer is made by Gesmundo Software in Michigan. I have not been able to contact them in the last year so they may be out of business.

The best fallback program is ScanCat Pro from Computer Aided Technologies, PO Box 18292, Shreveport, LA, 71118, 318-636-1234. It allows for a database of frequencys and full radio control.

If you live in the Windows World, there are some good programs up on CompuServ that were written in Visual Basic. Take a look around.

Let me know what you think

I found a flyer on the bus that had a picture of a GE SuperRadio III on it so naturally I picked it up. It turns out that the flyer was as ad for a 'specially equipped' GE superradio that would pick up Mormon religious programs which are transmitted on the subcarriers of certain broadcast FM stations (like KBIG in L.A., WMXV in New York, WTMX in Chicago, KISN in Salt Lake City (of course), etc.) Anyway, you had to order the radio preprogrammed to receive Mormon broadcasts in the city of your choice. What I want to know is, is there any type of general subcarrier coverage radio/scanner? How exactly do subcarriers work? I get the feeling that there might be a whole new world of scanning out there hiding in other broadcasts' subcarriers. Or has the FCC outlawed subcarrier scanning because you're 'decoding scrambled transmissions' or some such?

: >food thanks to some of their butt-headed employees. Prank-on Jason!
:
: How would it not be the same, concerning radio frequencies?
: Is it because one is a "necessary" service and the other is not?

Exactly. There is nothing to involve the FCC, since you are not transmitting,
or receiving illegal frequencies.

However, do it to a cop, and you are interfering with the performance of
his duties - a misdemeanor at least, and possibly a felony.

: Asking anyone to committ willful interference of a frequency
: (why, it's even illegal to do it on CB frequencies) is nowhere
: near mature.

They are not creating any interfering signal - that is what you cannot
seem to grasp, even though you have been told several times.

I do agree that is a childish prank.

: Regardless of whether or not you like/dislike McD's, their service,
: vigilante revenge via a radio is no way to get even.

Agreed.

Just thought I'd throw out a couple of comments...

Though I've only been scanning for a year or so, I have followed Metro Traffic in the D.C. area the whole time. In that year, I have only heard three reports get taped. One thing I have found worth while is monitoring the Metro Traffic repeater. Here in D.C it is 455.9125, and you hear all of the various planes feeding the information as they see it to the Metro Traffic base station. This provides much more detailed (and up to date) information than simply scanning 10 or so reporters repeating this information. Plus you don't have to listen to the commercial bite at the end of the report.

Shadow traffic has just started up in the past 6 months or so in this area and I have yet to find any of their frequencies. I do monitor their live reports to one of the radio stations though.

What is available on FM subcarrier is variable depends on your location. Here in Chicago you can find Chinese and Greek "narrowcast" broadcasts, Talking Book for the Blind, Commodity reports, and MANY digital signals including Mainstream (most real-time newswires).

You need to buy or make a unit to tune both 67khz and 92khz in order to hear multiple subcarriers. The Elving FM directory in the best published book on frequencies and SCS (800-944-0630), IMHO, makes the best demodulator SCA board and modified Superradio. I've been a happy customer of SCS's super modified (4 SCA frequencies) Superradio III.

I'm new to this, but it would seem to me that an FTP site to store FREQs would be a good idea. I have a few hundred megs of space on my machine (FREQs compress rather nicely), which is always up and running an FTP server.

If people would send me FREQs by state and function, I would make them available via anonymous FTP.

By the way, what are the legalities of this? Is this not public information distributed free?

Any opinions or flames accepted.

Message-ID: <1994Jul15.145533.9702@news.cs.brandeis.edu>
Source record: 271706

I just bought a Pro2006 to replace my Pro2021. And while I do love the advanced coverage and features of the 2006, one thing I have noticed is that its reception using the supplied antenna is far inferior to that of the 2021. I live around 15 miles outside of Boston, and the 2021 could pick up most Boston police and fire frequencies (in the 460 range) fairly well, even with the squelch at full blast. The 2006, on the other hand, only occasionally picks up one of the Boston frequencies, and not with great clarity. I also tried using the RS telescoping indoor antenna, which attached directly to the phono plug of the Pr02021 but needed a phono to BNC adaptor to attach to the 2006 (why doesn't RS make this antenna with a BNC adaptor?), and the results were the same: Pro2021 good reception, Pro2006 lousy. I don't have room for an outdoor antenna. Is anyone else having similar problems, and does anyone have any recommendations for a good indoor antenna system that doesn't requires miles of wire snaking all over the place? Any comments would be appreciated.

Maybe if you were to cite the context that it's used in.

That's the key to figuring out what's being said on the radio (especially cops). If they say there is a "code 2 driver operating erratically on route 16" you can be pretty sure that "code 2" means DWI/OUI.

OK - my (feeble) understanding was that the "A" was the newer, post April
26, non-upgradeable version. Guess not. What is the difference, then?

How would one tell a "new" PRO-2006 (or -43) from an old one?

: >

: What is the change in the model/FCC/serial number that indicates a 43-A?

They are the Radio Shack Rejects. They were rejected to the U.S.
due to not having a FULL 800 Mhz section. It's missing two
ranges. It is impossible to test for interference from Cellular
Transmitters using one of these scanners (the ECPA act specifically
permits this USE of monitoring cellular, how is the FCC planning
to permit sales of equipment to comply with this specific
activity???)

In any event, say NO to U.S. Dealers trying to sell non-restorable
scanners. Tell'em "SEND THEM BACK TO THE FACTORY, WE DO NOT, AND
WILL NOT BUY THEM", then using the phone and your credit card and
order from Canada or overseas.

Agreed. If my neighbor is playing his stereo real loud while I'm trying to
talk on a CB, I can do nothing to him based on _FCC_ rules. He's not
transmitting any radio waves (no radio waves = no FCC jurisdiction). Get
a clue people!

6422. Desolder-free cell mod for the Pro 43

Newsgroup: rec.radio.scanner
Date: 1994-07-15 20:11:33 UTC
From: tfoecke@nist.gov
Message-ID: <9407151611.AA33723@steel.nist.gov>
Source record: 271720
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I was somewhat intimidated with the Pro43 mod as presented in all of the postings I have found (not wanting to fry the board, etc) so I took the advice of someone on the net (sorry, I don't remember who, but thanks!) and went after the D4 diode without desoldering the unit. I bent up the left contact for the battery pack to get it out of the way and tilted the unit bottom up at about an 80 degree angle under a binocular microscope, and was able to see the row of diodes. It was easy to distinguish the D4 one, and I used a whittling knife to carefully scrape the solder off the top of the contact for the diode, wedged the knife under D4 and pried it up clear of the board. Works great!

Yeah, I don't get 51-88 Mhz, but I already have a TV . . .

: features that are most important to me are range and sound quality. Two
: line capablity might be nice, but it's not a real big deal. Any help
: will be greatly appriciated.

My first 900mhz cordless was a Tropez model. (The first one to come out).
After the battery went within a month and it stopped working I made the store
take it back and trade for a Panasonic KX-T9000R.

I really think that the Tropez had not worked out bugs in the
manufacturing process in the early days. A lot of people I know have
purchased recent models and are quite happy. I do like the random
security code selection each time you replace the phone in the cradle.

THis week I just received a catalog from Hello Direct (1-800-HI-HELLO)
which is a specialty phone catalog. Tropez now has 4 models now. A basic
phone ($229), a speaker phone model ($299), a 2 line model ($399), and a
model with headphones on the remote ($479).

I think these may be available elsewhere. Hello does seem to run a bit
higher that other places although I havn't seen these phones in other
catalogs.

I still like the Panasonic with it's small size, and dual batteries.
(One hint: Batteries are usually NOT covered by warranty. So never buy
replacements from the dealer where you got the phone. Mine wanted almost
$60 for a panasonic replacement battery. [The battery has a special case
that snaps on the back of the phone.] I carefully pried apart the case
and found the clasic 4 nicad in series power source. A trip to the
electronic parts house and I found one for $13. Solder the leads, snap
the case back together, and fire it up.)

My opinion, of course.

Perhaps this should be in alt.dcom.telecom

> Thanks.

I have the 40" telescoping antenna and Pro-2032 from Radio Shack. The longer antenna makes a noticeable difference at low frequencies (i.e. 46 to 49 MHz). At higher frequencies (i.e. 460 to 960 MHz), I have not noticed any difference, with the antenna extended or collapsed (instructions for the included and 40" antennas say to use them collapsed at high frequencies). Since the 40" antenna is inexpensive and does work at low frequencies where a longer antennas makes the most difference, I think it is a good deal.

Incidentally, a TV rabbit ear antenna will make a signficant improvement over the 40" antenna. By clipping the TV antenna to the top of the antenna included with my scanner, I pick up signals that are barely audible with the 40" antenna. Again, this is in the 46 to 49 MHz range. Some people in this newsgroup have had success at higher frequenices with tunable UHF TV antennas.

A friend hooks up his Kenwood HF receiver's antenna to his scanner's audio output. The Kenwood can tune down to 50KHz in FM mode, so you can tune to either the 67khz or 92khz subcarrier. Ideally, you would want to get inside the scanner and tap off just after the FM detector, but before all of the audio filters and amps. But there is enough residual signal left in the audio output of his Icom R-7000 that there is no need to do this. Your milage may vary depending on your scanner.

dale

P.S. I'm sorry I refered to the R-7000 as a 'scanner.' It is much, much more. :-)

10 Codes vary from place to place, and even from agency to agency. Here in NYC, there are different 10 codes used by the different police departments.

Try the "Police Call" book at Radioshed for your area for a good rundown of 10 codes.

I have a 10 Code list for the NYPD, if you want it I'll post it here.

LH> Are there any Mods for the PRO 23??? I have posted this question 3
LH> times with no response, so should I take silence as a clue that there
LH> are none?? Any assistance would be greatly appreciated. Thanks, Lee.

Hi, Lee...There are no hardware mods for the '23. But you can try this
if you'd like.

Product...Realistic Pro-51/Pro-23/Pro-46
Made by Uniden for Radio Shack, a Tandy Corp.

Purpose...Access gaps in the 800 Mhz band

** Disclaimer...Perfomring these steps are done at your own risk.

** Note...Perfoming these steps may access portions of the 800 Mhz band
that is against federal United States law to monitor.

** Certain portions of this document have been modified from the original
document to conform to the policy of several nets.

Information is from the July, 1994 issue of Monitoring Times p.99.
Further, Larry Wiland is given credit for providing these procedures.

1. With the radio switched off, hold down the 2, 9 and LOCKOUT keys;
turn the radio on and release the keys.

2. Step to channel 23 on the '51 or channel 15 on the '23 to display a
factory test freq in the 800 Mhz gap. (Not sure on the '46.)

3. Press either the up or down search arrow to scan the band in proper
30 khz steps. You may temporarily store up to 10 active freqs by pressing
MONITOR.

To permanantly store the freqs in the gap to have a starting point for
searching...

1. Step to the MONITOR channel you wish to permanantly store, then press
PROGRAM, then the desired memory channel number (including those with
factory-preprogrammed test frequencies.)

2. Press in sequence PROGRAM, MONITOR, ENTER. Repeat steps 1 and 2 for
each channel to be memorized.

6437. FEMA / World Cup

Newsgroup: rec.radio.scanner
Date: 1994-07-15 22:20:09 UTC
From: hammock@kelvin.jpl.nasa.gov
Message-ID: <30722p$jch@lo-fan.jpl.nasa.gov>
Source record: 271394

Some interesting information that I received from one of
our radio club members:

From: Jan.A.Tarsala
To: jplarc
Subject: FEMA Comm Van
Date: Friday, July 15, 1994 11:40AM
Priority: High

Captain John Pinedo of the Pasadena Fire Department
graciously led a presentation and tour yesterday
evening of the non-military communications facilities
brought in to the Rosemont Pavillion for the World Cup.
These included the State of California Office of
Emergency Services Ku-band VSAT trailer-mounted telephone
terminal and the Federal Emergency Management Agency
Multi Radio Vehicle. The Multi Radio Vehicle was
particularly interesting as it contains:

Redundant 25 KVA diesel alternators

An environmental control system good for -25 C to +60 C

Three Harris RF 350K 500 W auto-tune 1.6 MHz to 29.999 MHz
transceivers

A Motorola MCX-1000 VHF repeater with PL, DPL (digital PL),
DES (Data Encryption Standard), and DVP (Digital Voice
Protection)

A Motorola SPECTRA UHF repeater with PL, DPL, DES, and DVP

A Motorola SPECTRA 800 MHz/900 MHz repeater with PL, DPL,
DES, and DVP capable of both conventional and trunked
operation

Four Magnavox VRC-83 HF/VHF/UHF multi-mode military
aircraft radios

A Magnavox URC-110 FLTSATCOM UHF terminal

Bandpass filters for all the above

A Ku-band video uplink currently on SBS 6 translator
three Antennas, some field-erectable, for all the above

And about a zillion Motorola SABER 138 MHz band VHF
handheld radios

The purpose of the Multi Radio Vehicle is to implement up to six bent-pipe repeaters simultaneously to allow government agencies with otherwise incompatible radios and frequencies to communicate in an absolutely transparent manner.

The FEMA representatives indicated that their greatest weakness was in not having MODAT (Motorla VHF/UHF mobile data terminal), packet, and HF SITOR (the commercial version of AMTOR) capability. All I saw inside was a Baudot RTTY terminal for data communications.

While inside, I noted the following frequencies in use:

138.400 MHz carrier access RX & TX

138.575 MHz PL 118.8 Hz RX & TX

139.825 MHz carrier access RX & 148.575 MHz TX

139.950 MHz PL 118.8 MHz RX & TX

155.340 MHz carrier access RX & TX

the Ku-band video uplink

and, of all things, 225.000 MHz AM.

This tractor-trailer truck is one of five dispersed nationwide. It has an 800 mile driving range before refueling, and it is and has been transported by C-5A Galaxy military cargo planes (it is too large for a C-141 Starlifter or a C-130 Hercules).

Your tax money is at work.

73,

de VRN

[A dig at NO6B: This just goes to show, Bob, that when you want the best radios, you buy Motorola. BFFFFFTT !!]

Hi, Nick...
Not sure how Stanford's procedure is. Here in Chicago, there is Loyola Lifestar helo that is dispatched from time to time. Basically, the procedure here is that the pilots are toned out just like the fire dept is. After a brief period, they are told what hospital or location to report to to pick up the patient. Sometimes, they are told what the condition of the patient is, what the reason is for transport to Loyola and vital signs. After pickup, Lifestar usually checks in to give an ETA back to Loyola and the vital signs are transmitted again.

> for air-ground, or are there special freq's set aside?
>

Around here (Phoenix) I can usually here AirEvac being dispatched and
can here the conversation between the pilot and the dispatcher. This
usually includes the location of where the copter is going to land,
which hospital it's going to, and patient information (number, status,
vitals). All this happens on one freq. (155.325)

The police copters, Firebirds, use the same tactical freq's as the
ground units. They also have the ability to switch to the freqs of
neighboring police departments (except Glendale's trunked 800 system.)

I do this all the time on my old ICOM R-70 with FM board. There is an FAQ
file around here which tells you how to make the interface (basically a
resistor and blocking capacitor) to put in between the speaker output and
antenna input of the two radios. I built it into a 35mm film can ages ago.

The frequencies used in Friday's Thunderbird performance
at the Hillsboro, Oregon airshow are as follows. They
may continue to use them on Saturday and Sunday, hence
this posting.

Main Group 143.850
Small Group 122.150

I'm thinking about taking up scanning as a hobby. What brands of scanners do you recommend? I'm pretty sure I'll like it, so should I shell out $400 for a pro-2006?

>available for this scanner anyplace?

Schematics for the 2004 are available at your local Radio Shack, (they
will have to order it), or you can call Tandy Parts. I don't have the
phone number, but 800 directory assistance should.

What you are doing has been done before. There is a full blown interface
that not only punches the keys, but reads the LCD data. Also, there
are plans floating around for keyboard interfaces using the printer port.

Funny, this discussion was on one of the .transportation newsgroups not long ago. The feeling seemed to be that Socalians name their freeways "The Santa Monica" (meaning I-10), "The Hollywood" (US 101), etc. We don't call our "The J. Arthur Younger" (SR 92) or "The Nimitz" (formerly SR 17 now I-880 in the Oakland/Hayward area). It *used* to be the Nimitz, but I haven't heard it called that in ages.

I have a PRO-2021 200 channel mobile/base scanner with tape output, AC/DC
power operation, Motorola external jack for external antenna. LCD
backlit display, Priority channel set, delay, full searching functions,
recieves the usual and aircraft (sorry guys, no cellular on this one),
solid metal case (no plastic) and no intermod problems (at least where I
live). Reception is great and the speaker volume is very loud! No
external speaker needed, however there is an external speaker jack in
case you want to hook one up.

Radio has absolutely no problems and I have the owners manual and tons of
Federal Government Freq Sheets (all the ones you would want). I am
asking $125.00 firm for the unit and I will pay the shipping anywhere in
the United States. If outside the U.S., I will let you know the cost
with shipping.

Only serious buyers need reply.

Thanks,

Jeffery Shaub (shaub@cs.uwp.edu) once wrote:

: If people would send me FREQs by state and function, I would make them
: available via anonymous FTP.

: By the way, what are the legalities of this? Is this not public
: information distributed free?

It is my understanding that as long as the compilation of frequencies
is from a primary source (each individual) there are no legal issues
involved. Contrast this to a secondary source such as _Police Call_,
where if someone were to copy the freqs verbatim and post them to the
server, that would be illegal. (Unless the editors of _Police Call_
gave permission.) I believe that most published lists contain
key errors that can identify the list of freqs as a duplicate of the
copyrighted source.

I may be wrong,
Paul

DB> to the main CPU board by a 13-conductor header.

That's right.

DB> I assume the keypad is
DB> wired as a 6x5 switch matrix with the other two leads being grounds...

That's incorrect. According to the schematic, the switch matrix is 8x4 with only one lead being ground (pin 13) and that is the shield ground, I believe.

DB> has anybody else tinkered with the keypad? Or even better, are
DB> schematics available for this scanner anyplace?

There is a schematic available from Tandy Ntl. Parts.

Tandy Computer Services
Tandy National Parts
900 E North Side Drive
Forth Worth TX 76102
(800) 442-2425

Give them a call and have a credit card ready. They will send you out one and you should get it in about a week.

I added a remote keypad on a 2004 for a friend awhile back. I vaguely remember how it was done. Can't check it out now because the Michigan Police confiscated it several years ago. I believe I used ribbon cable and wired it up to the bottom of the CPU board. Then, I added a male connector to the other side so that it would plug into the second keypad cable. This way, he was able to lockout channels remotely. For some reason, he wanted all of the keypads wired up, even though he couldn't see what he was programming.

I'll quit babbling now.
Jerry

P.S. Mickey did a nice breakdown of the schematic. The first L/O that Mickey has is actually L/O Review.

* Originally dated 16 Jul 1994, 12:20

I am interested in selling my modified PRO-2004 scanner so I can afford more N-scale model train equipment.

The PRO-2004 is the predecessor to the current topline PRO-2006 scanner by Realistic (Radio Shack). It is the one with the sloping cabinet face and the all metal case. As it came out of the box it had 300 channels and cellular was blocked out, but restorable.

The modifications:

Diode added for 400 channel capability.
10-segment 3-color LED signal strength meter.
5-position 3-color LED center tune indicator.
New memory chip providing 6,400 channels in 16 blocks of 400 (like having 16 PRO-2004's in the same case).
Internal transformer removed to reduce heat and component aging (unit only runs on 12 VDC).

Added hardware:

AIE TCF-4 Tone Finder/User, which displays any CTCSS (PL) tone or digital squelch code in use. It can be programmed to decode any tone or code and control the squelch, with up to 10 tones/codes per scanner channel.

Total original cost of the basic unmodified scanner and the tone finder was around $750.

Asking price is $400.00 FIRM. If you aren't close enough to pick it up in person, I will pay UPS brown label shipping. Personal checks will have to clear before shipping.

It can be pretty interesting if you are also a dufus and you know the dufus in the McD's. You see, the headsets they wear transmit all the time, even when no one is at the drive-through. So during idle moments when they chat about whatever it is they chat about, you can listen in.

Still not as much fun as listening to baby monitors, IMO.

It's hard to tell from your post what you are really looking for. There are companies, like Petrocom in the Gulf of Mexico, which maintain supercell sites on platforms offshore for the use of marine traffic, and these use exactly the same frequencies as land-based systems, though they cost more to use.

If you are talking about the frequencies on which can get a phone patch made on a Marine VHF radio, they are contained in the FAQs posted here frequently. You might wish to try to clarify what it is you want to know, if you can.

Heh ... if I'd remembered I would have posted the circuit in the first
place. It came from an old FAQ on SCA listening ... I believe written
originally by Bob Parnass. I'll see if I can dig it out this weekend.

Source record: 271763

Just picked up my 2500XLT this week at HRO. Just wondering if there are any mods available for it yet. Not interested in a cell mod (I have my Icom W2A if I want to hear cell) but any other mods would be appreciated.
Also any reviews would also be helpful. For now all I have noticed was that there are a few more "birdies" on the 2500XLT than the 200XLT. Also the 200XLT seems a little more sensitive in the 46mhz range than the 2500XLT. Other than that it works fine. I guess I'll wait and see!

6471. Can PRO-31 be modified?

Newsgroup: rec.radio.scanner
Date: 1994-07-17 03:33:21 UTC
From: tonym@melbpc.org.au
Message-ID: <30a8q1$bm@server.melbpc.org.au>
Source record: 271770

I have a Realistic PRO-31 scanner (old, I know, around '85 I think?). It handles 68-88Mhz (although the manual says 30-54 which it *can't* do) 138-174Mhz 380-512Mhz.

Can this scanner be modified to receive extra frequencies as I hear other scanners can be done? Is there an FTP site with info on this?

Second question: Anybody know what frequency those popular (well, I have one) Panasonic cordless phones use? They call them EASA-PHONES down here - pocket phone with a base station (you can't dial out from the base station - must use the pocket phone).

Thanks in anticipation.

I just looked at the scanner and the switch I was referring to is
labelled "ATT" for attenuation, and has a 0 db and 10 db position.
With 10 db of attenuation, the sensitivity is pretty low!

Message-ID: <joeCt3D2L.DxB@netcom.com>
Source record: 271630

Yes, Science Workshop is still actively selling Spectrum Analyzer kits and a book of collected Poor Man's SA articles. The kits are alot of fun to build but you still need misc parts to assemble like 10 turn pots, power transformer, etc.

The theory of the PMSA is simple - a low cost TV varactor tuner provides the RF front-end, a few chip sweep generator for the tuning ramp voltage, and an IF/Dec strip for the if. Great concept!

Some problems:

o Non-linear Sweep making calibration critical everytime you use it

o Amplitude Log - Not really a log function for amplitude

o Slight Drift - Designed for a TV, the Tuner Drifts Slightly

The good news is that it works, the new tuners are very sensitive, and Pioneer Software makes a PC adaptor program where you can calibrate the amplitude and frequency.

We need to start a mailing list or a newsgroup on the PMSA!!!

GAT> If it is possible to modify the newer units I would appreciate
GAT> knowing how to do this. Thank you for your attention.

Hi, Greg...It is my understanding that the 8500 could not be modified at all. Uniden put the new, non-restorable chip in the 8500 because the original chip had to many birdies. They figured, while they had to burn a new chip, they might as well comply with the Telecommunications law early.

Source record: 271605

-=> Quoting Nicholas McLarty to All <=-

NM> I was curious if you could go about modifying the PRO-34 to widen
NM> its coverage. If possible, I would like to focus on opening up the
NM> 220 MHz amateur band, 830 and 870 MHz Cellular and Trunking band,
NM> and possibly the high end of HF (25-30 MHz). Thanks.

Hi, Nick...You might as well forget the 220 Mhz band. It can't be done.
I don't believe the 25-30 is possible either...haven't seen anything.
But...All is not lost.

Product: Realistic PRO-34
Purpose: Restore continuous 800 Mhz coverage

** Disclaimer...Doing this procedure is done at your own risk. This
procedure is fairly complicated and should not be attempted by anyone
unfamiliar with soldering small circuit boards. **

** Warning...Performing this modification restores certain portions of
the 800 Mhz band that is prohibited by U.S. federal law to monitor. **

The following procedure is from the December, 1988 issue of Monitoring
Times, page 89.

1. Remove the battery cover and battery, four black screws from the rear
cover, and volume and squelch knobs.

2. Remove the rear cover, lifting back and upwards to clear the control
shafts (do not remove belt clip or circuit board screws.)

3. Unplug the brown volume control connector (green, yellow, black
cable) and white squelch cable connector (white, black, red cable) from the
linear circuit board.

4. Unsolder the ground lead from T111 (at the corner of the linear
circuit board above the external power connectors). (My note- my
particular unit didn't have this connection. This may be true of other
units.) Unsolder the two power switch leads from the back of the volume
control. Unsolder the antenna connector center pin and ground leads from
the linear circuit board.

5. Unsecre the four combination screws that hold the linear circuit
board
and held the rear cover screws. Grasp the linear circuit board at the top
and lift it straight away from the front case, unplugging the 16 pin
connector.

6. Remove the three screws holding the metal frame assembly which held the linear circuit board to the front panel. Unplug the red-black power lead and lay the frame aside (it is still connected to the battery contacts).

7. Locate diodes D9-D12 on the volume control side of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap slightly (it may be resoldered later if desired).

8. Re-assemble the board by reversing the disassembly procedure.

For information...D9 enables 66-88 Mhz, though re-alignment is required and 30-54 Mhz band is lost. D10 enables 896.1125-960 Mhz and is already installed. D12 disables 136-146 Mhz. I found on my unit, which was older, D12 changed the stepping of 12.5 Khz on certain portions of the band where 30 khz would be the default.

Source record: 271606

-=> Quoting briskin@binah.cc.brandeis.edu to All <=-

br> I just bought a Pro2006 to replace my Pro2021. And while I do
br> love the advanced coverage and features of the 2006, one
br> thing I have noticed is that its reception using the supplied
br> antenna is far inferior to that of the 2021. I live around
br> 15 miles outside of Boston, and the 2021 could pick up most
br> Boston police and fire frequencies (in the 460 range) fairly
br> well, even with the squelch at full blast. The 2006, on the
br> other hand, only occasionally picks up one of the Boston
br> frequencies, and not with great clarity.
(truncated for brevity)

Hmmm...check the back of the unit for a switch labeled ATT 0db and 10 db.
If the switch is set to the 10 position, that will be the reason you can't
hear Boston PD. Switch it to the 0 position and notice the difference. <g>

If it is set at 0db, then you may have a defective unit. Return for a
replacement.

BJRL> religious programs which are transmitted on the subcarriers of certain
BJRL> broadcast FM stations (like KBIG in L.A., WMXV in New York, WTMX in
BJRL> Chicago, KISN in Salt Lake City (of course), etc.) Anyway, you had to
BJRL> order the radio preprogrammed to receive Mormon broadcasts in the city
BJRL> of your choice. What I want to know is, is there any type of general
BJRL> subcarrier coverage radio/scanner? How exactly do subcarriers work? I
BJRL> get the feeling that there might be a whole new world of scanning out
BJRL> there hiding in other broadcasts' subcarriers. Or has the FCC outlawed
BJRL> subcarrier scanning because you're 'decoding scrambled transmissions'
BJRL> or some such?

Hi, Bruce...Sub-carrier is what it says...it is a second signal riding on the original signal. It's like a trailer being pulled by a car is a good analogy without getting too technical. Many people don't know this, but FM stereo is a type of sub-carrier. It's just that receivers have the decoding circuit built in.

Federal law states that it is illegal to listen to SCA broadcasts. (Believe the ECPA of 1986 states this.) The users of SCA are charged money to have access to these services. I have known some users to write to the radio station asking permission to monitor them as they are using it for their personel use and not for a business.

Most communication tech books have a schematic to build your own SCA receiver using simple components. They can be built for less than $20 bucks.

6482. Freedom of Information Act?

Newsgroup: rec.radio.scanner
Date: 1994-07-17 16:35:56 UTC
From: kjn@netcom.com
Message-ID: <kjnCt3FFw.Cts@netcom.com>
Source record: 271631

Anyone out here had any experience with invoking provisions of the
Freedom of Information Act to obtain frequencies from a federal agency
that is stonewalling? We know the location of the document in question
and the person charged with its maintenance.

The agency is not involved in classified research nor law enforcement but
rather scientific research for the public domain. The individual who
maintains the file has expressed concern that the frequencies might become
published and could lead to vandalism of equipment installed at remote
locations. The exact locations of the sites are already in the public domain
and vandalism has not been a problem.

Any information would be appreciated.
Thanks!

RC>I use an NRD525 for the same function. IT works fine.

I just tried it by connecting the headphone output of my R7000 to
the coax input of my NRD525 using a 1uF coupling cap. It worked.
So far, most of the subcarrier broadcast seem to be foreign language
(spanish & chinese so far) or musak. Both 67 & 92 Khz FM are active.
I wonder if any non-vocal digital or FSK tone signals (ie stock
market ticker tape) are broadcast on sub-carriers?

Try ftping to enlow.com and get the 00index.txt
This a *fun* ftp site and has lots of interesting tidbits on all sorts of
things. It is a bit dated though, and not too many new files are apparent.
Perhaps it was a bbs mirror site or something. I heard about it awhile back
on alt.2600. I'm sure we would all like to hear about other good sites.
Especially ones which have directories appropriated exclusively to scanners,
or frequencies. I am intersted particularly in military freqs and haven't been
able to find any ftp sites that have files which are of any help. Any pointers
would be great.

I've seen several postings regarding discone vs. general reception antennas. My reception of military air is non-existant but I heard someone on a local scanner net say that he had the same problem until he switched to the Radio Shack discone. From what I read the discone is not good for below 100 mhz. How critical is this loss ? Is the RS discone a good choice, how about the discone sold by Grove or others ? Any info or recommendations would be appreciated.

IR>there's no sense taking twenty pounds of hardware if there's nothing worth
IR>listening to! Any suggestions appreciated.

IR>Robert

We have plenty to listen to up here. And most of it comes in all over
San Jose. San Jose alone has several police and fire freqs. We have our
goold old fashioned international airport, medical helicopters, plenty
of high tech firms, and CDF units for the hills.

Basically, VHF, UHF, and 800 MHz(our paramedic units) are all covered.
In my opinion we do not have as much inter-mod as L.A. or cities of that
size, but we are getting there. Some of our police channels can get
inter-mod from San Francisco(60 miles north) but other than that, good
listening.

Feel free to e-mail me for a current and comprehensive freq list.

I think I figured out what he's talking about. Go to the channel
number that you want to store the freq in, search for the freq, press
enter when you find it. The freq is now stored in the channel.
You can go to the next channel and then start searching from where you
left off.

In regards to the posts asking why monitor McDonald's, Wal Mart, or other fast food and Department stores, you can turn up some very interesting traffic. For example, I was told of a couple of young ladies(?) at my local Burger King using their drive-thru radios to discuss their sex lives. Very spicy!

Bill Cheek said he has one of these cards. It sounded amazing. It has like
16 Mb of ram and stores all the audio by frequency so you can scan lots of
channels and then go back later and listen to all the traffic one channel at a
time. It puts time stamp on it etc. I doubt it will be cheap!

I don't think the scanner manufacturers want to be on the fringe of the law. Sure it might be legal now to sell such kits, but based on the success of the cellular lobby, if companies started selling such kits, a law would be quickly passed to make these illegal too. I doubt any company would spend much money on a product that is destined to be outlawed.

Now, if some garage business started selling such a product, the cellular industry might be much slower to respond, as they may not see any real threat to cellular privacy.

Unfortunately there is no FCC id code on Canadian units. All the
ones i've seen lately still have the 3A4 sticker however, so if that
implies modifiable then...

Out of curiosity, is there any difference between Canadian units and
the previous American units aside from the FCC id?

DE> I would appreciate any comments pro or con from users of the BC
DE> 2500XLT.

If you would have asked this question last year, the 2500 would have been trashed. Since then, Uniden has improved on the unit on later units. Has a nice hit counter, search and store, able to pick up the 220 Mhz band, 400 channels, 100 cps scan rate, cellular restorable.

The unit was plagued with intermod early on, but Uniden has modified the units to repair the problem.

The 2500 won't be around for too much longer. It has been confirmed by a source on CompuServe that it will be replaced by a Bearcat 3000, which will add the capabilities of the 220 XLT to the unit. (Service search, 300 cps)

6513. MVT-7100D, narrow AM mod

Newsgroup: rec.radio.scanner
Date: 1994-07-18 13:03:58 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <30ed7a$1sf@mrnews.mro.dec.com>
Source record: 271664

Over the weekend I opened my 7100D to look for a frequency adjustment trimmer. My 7100 on narrow FM seems to be off by about 2KHz (low). I finds this annoying on weak signals.
While snooping around I noticed 3 wires soldered to the LOCK switch. This switch turns on a so called narrow AM mode for improved SW listening.
I followed the wires over and noticed no special filter. I am wondering if the SSB modes has a narrow filter and this mod is nothing more than forcing it on??

Does anyone know what the adjustment would be to shift the received frequency up by 2KHz?? On weak stations it is slightly distored but when I retune I can correct it. I have noticed this on vhf and up in the narrow FM mode.

TM>
TM> Can this scanner be modified to receive extra frequencies as I hear
TM> other scanners can be done? Is there an FTP site with info on this?

Hi, Tony...No, extra freqs can't be extracted from this unit. I suspect
you can get 30-54 by moving a diode around (don't know which) but you will
lose the 68-88 Mhz and may have to have the unit re-align.

>out there who has the specs on this? Could they actually be found on the
>net? So much cool digital decoding can be done with a sound card, even if
>not in real-time...

Here is some info that I think was originally posted by Dave Emery:

The following summary describes the coding used on POCSAG pager signals and may be of interest to those curious about what those ear-splitting beeps and buzzes mean and how they encode data. This summary is based on a very old text of the standard from my files; the current text of the POCSAG standard is available as CCIR Radiopaging Format 1.

Note that some current POCSAG signals (so called Super-POCSAG) transmit paging at 1200 or 2400 baud instead of the 512 baud I refer to here, but use essentially a similar coding standard.

The interested USA reader is reminded that willfully intercepting other than tone only paging is a violation of the ECPA with similar penalties and criminal status to willfully intercepting cellular phone calls.

The interested reader is advised that at least two of Universal Shortwave's RTTY reading devices (the M8000 and the new C-400) are capable of reading at least the older 512 baud version of POCSAG paging, so commercial devices for this purpose are currently being sold in the USA.

And finally, much alphanumeric paging - particularly that installed some time ago, uses a proprietary Motorola encoding format called GOLAY which is quite different from POCSAG. The two can be told apart by their baud rates - GOLAY is 600 baud.

POCSAG

First POCSAG stands for Post Office Code Standarization Advisory Group. Post office in this context is the British Post Office which used to be the supplier of all telecommunications services in England before privatization.

POCSAG as defined in the standard, (original POCSAG) is 512 bits per second direct FSK (not AFSK) of the carrier wave with +- 4.5 khz shift (less deviation than that is used in some US systems). Data is NRZ coded with the higher frequency representing 0 (space) and the lower one representing 1 (mark).

The basic unit of data in a POCSAG message is the codeword which is always a 32 bit long entity. The most significant bit of a codeword is transmitted first followed immediately by the next most significant bit and so forth. The data is NRZ, so that mark and space values (plus and minus voltages) as sampled on the output of the receiver discriminator at a 512 hz rate corrospond directly to bits in the codeword starting with the MSB. (Note that the audio output circuitry following the discriminator in a typical voice scanner may considerably distort this square wave pattern of bits, so it is best to take the signal directly off the discriminator before the audio filtering).

The first (msb) bit of every POCSAG codeword (bit 31) indicates whether the codeword is an address codeword (pager address) (bit 31 = 0) or a message codeword (bit 31 = 1). The two codeword types have have different internal structure.

Message codewords (bit 31 = 1) use the 20 bits starting at bit 30 (bit 30-11) as message data. Address codewords (bit 31 = 0) use 18 bits starting at bit 30 as address (bits 30-13) and bits 12 and 11 as function bits which indicate the type and format of the page. Bits 10 through 1 of both types of codewords are the bits of a BCH (31,21) block ECC code computed over the first 31 bits of the codeword, and bit 0 of both codeword types is an even parity bit.

The BCH ECC code used provides a 6 bit hamming distance between all valid codewords in the possible set (that is every valid 32 bit codeword differs from ever other one in at least 6 bits). This makes one or two bit error correction of codewords possible, and provides a robust error detection capability (very low chance of false pages). The generating polynomial for the (31,21) BCH code is x**10 + x**9 + x**8 + x**6 + x**5 + x**3 + 1.

Codewords are transmitted in groups of 16 (called batches), and each batch is preceeded by a special 17th codeword which contains a fixed frame synchronization pattern. At least as of the date of the spec I have, this sync magic word was 0x7CD215D8.

Batches of codewords in a transmission are preceeded by a start of transmission preamble of reversals (10101010101 pattern) which must be at least 576 bits long. Thus a transmission (paging burst) consists of carrier turnon during which it is modulated with 512 baud reversals (the preamble pattern) followed by at least 576/512 seconds worth of actual preamble, and then a sync codeword (0x7CD215D8), followed by 16 data/address codewords, another sync codeword, 16 more data/address codewords and so forth until the traffic is completely transmitted. As far I am aware there is no specified postamble. I beleive that all 16 of the last codewords of a transmission are always sent before the carrier is shut off, and if there is no message to be sent in them the idle codeword (0x7A89C197) is sent. Later versions of the standard may have modified this however.

In order to save on battery power and not require that a pager receive all the bits of an entire transmission (allowing the receiver

to be turned off most of the time, even when a message is being transmitted on the channel) a convention for addressing has been incorperated which splits the pager population into 8 groups. Members of each group only pay attention to the two address code words following the synch codeword of a block that corrospond to their group. This means that as far as addressing is concerned, the 16 codewords in a batch are divided into 8 frames of two codewords apiece and any given pager pays attention only to the two in the frame to which it assigned.

A message to a pager consists of an address codeword in the proper two codeword frame within the batch to match the recipients frame assignment (based on the low three bits of the recipient's 21 bit effective address), and between 0 and n of the immediately following code words which contain the message text. A message is terminated by either another address code word or an idle codeword. Idle codewords have the special hex value of 0x7A89C197. A message with a long text may potentially spill over between two or more 17 codeword batches.

Space in a batch between the end of a message in a transmission and either the end of the batch or the start of the next message (which of course can only start in the two correct two codeword frame assigned to the recipient) is filled with idle codewords. A long message which spills between two or more batches does not disrupt the batch structure (sync codeword and 16 data/address code words - sync code word and 16 data/address codewords and so forth) so it is possible for a pager not being addressed to predict when to next listen for its address and only turn on it's receiver then.

The early standard text I have available to me specifies a 21 bit address format for a pager (I beleive this has been extended since) with the upper 18 bits of a pager's address mapping into bits 30-13 of the address codeword and the lower 3 bits specifiying which codewords within a 17 codeword batch to look at for possible messages. The address space is further subdivided into 4 different message classes as specified by the function bits (bits 12 and 11 of a codeword). These address classes corrospond to different message types (for example bits 12 and 11 both zero indicate a numeric message encoded in 4 bit BCD, whilst bits 12 and 11 both set to 1 indicate an alpha message encoded in 7 bit ASCII). It was apparently envisioned that a given pager could have different addresses for different message types.

There are two message coding formats defined for the text of messages, BCD and 7 bit ASCII. BCD encoding packs 4 bit BCD symbols 5 to a codeword into bits 30-11. The most significant nibble (bits 30,29,28,27) is the leftmost (or most significant) of a BCD coded numeric datum. Values beyond 9 in each nibble (ie 0xA through 0xF) are encoded as follows:

0xA Reserved (probably used for something now - address extension ?)
0xB Character U (for urgency)
0xC " ", Space (blank)
0xD "-", Hyphen (or dash)
0xE ")", Left bracket

0xF "(", Right bracket

BCD messages are space padded with trailing 0xC's to fill the codeword. As far as I know there is no POCSAG specified restriction on length but particular pagers of course have a fixed number of characters in their display.

Alphanumeric messages are encoded in 7 bit ASCII characters packed into the 20 bit data area of a message codeword (bits 30-11). Since four seven bit characters are 21 rather than 20 bits and the designers of the standard did not want to waste transmission time, they chose to pack the first 20 bits of an ASCII message into the first code word, the next 20 bits of a message into the next codeword and so forth. This means that a 7 bit ASCII character of a message that falls on a boundary can and will be split between two code words, and that the alignment of character boundaries in a particular alpha message code word depends on which code word it is of a message. Within a codeword 7 bit characters are packed from left to right (MSB to LSB). The LSB of an ASCII character is sent first (is the MSB in the codeword) as per standard ASCII transmission conventions, so viewed as bits inside a codeword the characters are bit reversed.

ASCII messages are terminated with ETX, or EOT (my documentation on this is vague) and the remainder of the last message codeword is padded to the right with zeros (which looks like some number of NULL characters with the last one possibly partial (less than 7 bits)).

The documentation I have does not specify how long a ASCII message may be, but I suspect that subsequent standards have probably addressed the issue and perhaps defined a higher level message protocol for partitioning messages into pieces. The POCSAG standard clearly does seem to allow for the notion of encoding messages as mixed strings of 7 bit alpha encoded text and 4 bit BCD numerics, and it is at least possible that some pagers and paging systems use this to reduce message transmission time (probably by using some character other than ETX to delimit a partial ASCII message fragment).

The RF Spectrum one of Chicago's newest scanner related bbs's has just
added an online frequency database.
If you live or are interested is frequencys for the following states you
might want to give it a call.
Illinois
Indiana
Michigan
Kentucky
Ohio
Pennsylvania
New Jersey
Tennessee
North Carolina
Virginia

The RF Spectrum has the complete listings of all frequencys for those states.
As well as over 5000 radio and electronic related files.
You can call in at up to 14.4 kbs
The number is 312-581-3850

My 2006 switch says "LIGHT", not "display" or "dimmer". The plate in the
back says 145-A, and this model was modifiable to get back cellular. Do
I have some sort of half-breed model?

Why does everyone (almost) jump on this guys case for a silly prank, yet
there is an abundance of talk on here about listening to cellular phone
calls (undoubtly illegal)?

It's probably as likely that anyone at McD's would realize someone gave
em feedback, as the average cellular phone user would know someone was
spying on them.

Pete,

I have the same problem (I'm in Pewaukee). There is a ham re-broadcast out of Wausau, but I haven't been able to pick it up. You probably need a short-wave radio. At least as far as I can tell.

Let me know if you find anything we can pick up here in Milwaukee...

In <xmyziZN.scanlock@delphi.com> states:

|It's the same thing with the cell lock. But resets don't work. It's a
|changed Processor.

Please explain.

(1) By "resets don't work" what does this mean? That there's a pushbutton or switch is inside for resetting the microprocessor?

(2) By "It's a changed Processor" what does this mean? That the EEPROM configuration of the TR-1200 no longer contains the frequency limits, or that the microprocessor has some sort of built-in cellular lock that can't be circumvented?

HAMFEST/COMPUTERFEST CALENDAR 1994 - NORTHERN ILLINOIS
last updated June 9, 1994 |

o Please report additions or changes to Bob Parnass,
AJ9S, office phone: (708)979-5414, electronic
mail: parnass@ihlpf.att.com.

JULY

July 24, Sunday: Stickney, IL - DuPage ARC hamfest,
Hawthorne Race Course, 3500 South Cicero Ave. Handicap
accessible. Starts at 6 AM. Talk in on 142.25 MHz
with 107.2 PL. (-600). VE Testing 9 - 12. Advance
tickets are $4.00, $5.00 at the door.

This hamfest used to be held at the American Legion in
Downers Grove and was a good small to medium-sized ham-
fest. This year, there will be a 30,000 square foot
indoor exhibit area in an air conditioned building,
plus outdoor tailgating.

For advance tickets, send check payable to DARC,
enclose SASE, and send to Hamfest 94, 7511 Walnut Ave,
Woodridge, IL 60517. For commercial or fleamarket
tables info, call 708-985-9256.

July 31, Sunday: Sugar Grove, IL - Fox River Radio |
League (FRRL) Hamfest, Waubonsee Community College, |
Route 47 at Harter Road, 5 miles NW of Aurora, IL. Set |
up Sat 7 PM, Sun 6-8 AM, open to public 8 AM. Commer- |
cial dealers, flea market, computer vendors, refresh- |
ments. VE session: 10 AM (bring original license, a |
copy of license & photo ID). Free parking, camping |
nearby. Talk In on: 146.58/147.66. Adm: adv $4, door |
$5. Table: 8 ft $10. For advance tickets and informa- |
tion contact: Fox River Radio League, Box 673, Bata- |
via, IL 60510-673 or call Diana Skube, WD9API (708- |
293-7485), or Mark Hougaard, KB9FCC (708-810-1805).

July 31, Sunday: Racine, WI - Racine Hamfest, Sponsor:
Racine Megacycle Club - W9UDU South Hills Country Club,
East Frontage Rd. I-94 Between Hwy 20 & K. Advanced
admission SASE & $3.00. Send to: RMC P.O. Box 3
Racine, WI 53401. Information: 414-554-7565 - WB9USI

AUGUST

August 6, Saturday: Goshen, IN - Elkhart County Hamfest Sponsor: Elkhart County Radio Association Elkhart County 4-H Fair Grounds. 8AM to 3PM Advanced Tickets (till 7/1) $4.00, $5.00 at Gate. Send Ticket Requests or Table Reservations to: Elkhart County Hamfest, 20294 C.R. 36, Goshen, IN 46526 Information: 219-533-7632 - Jocelyne WZ9M

August 7, Sunday: Peotone, Il - Hamfesters Hamfest Will County Fairgrounds, Peotone, Il. Take I-57 South to Peotone Exit 327 (East). Flea market open 6:00am - 3:00pm. Tickets $4.00 advance w/double stub & $5.00 at gate w/single stub. No additional charge for flea market space. For advance tickets and information contact: Hamfesters Radio Club, Box 42792, Chicago, Il. 60642 or call Amateur Radio Info-Line: 1-708-535-AHAM

August 28, Sunday: Woodstock, IL - Tri-County Hamfest, Sponsor: Tri-County Radio Group, Inc. McHenry County Fairgrounds, Rte. 47 Junst North of Rte. 14. (Only 14 miles North of I90 on Rte. 47.) Advanced Tickets: $4.00, At The Door: $5.00 For advance tickets send check to: T.C.R.G., P.O. Box 3107, Skokie, IL 60076-6107 Information: 708-658-1678 Talk in on: 146.52

SEPTEMBER

September 11, Sunday: Joliet, IL - Bolingbrook ARS Ham/Computerfest, Inwood Recreation Center, 3000 W. Jefferson. This is a medium size hamfest with indoor/outdoor flea market. Gates open 8 AM for general public. Outdoor flea market on paved lot -- setup at 6 AM. Use Exit 253 from I55, or Exits 126/130 from I80. Admission $5. VE testing 9 AM - 12 noon. Bring original license and photocopy, ID and photo ID, plus $5.75 test fee. Novice-only tests are free. Talk-in 147.33, 224.54, and 443.525 MHz repeaters. Indoor table reservation, call Ed Weinstein at 708-085-0527. Info, BARS Hotline (708)759-7005 between 6 AM and 9 PM.

September 17-18, Saturday & Sunday: Peoria, IL - Superfest. Admission $5. For more info call (309)685-6698. Talk in on 146.76 (-600 kHz offset).

September 24-25, Saturday & Sunday: Grayslake, IL - Chicago FM Club, Ham Radio Expo. This is a large hamfest with indoor and outdoor flea markets. Lake County Fairgrounds, Rts 45 & 120. 6AM - 6PM. Info 146.76 MHz (-600). Admission $6 at gate, one ticket good for 2 days. Kids under 12 free.

OCTOBER

October 23, Sunday: Waukesha, WI - Kettle Moraine Ham-
fest Sponsor: Kettle Moraine Radio Amateurs Waukesha
County Exposition Center Forum Building, Highways J and
FT All orders MUST be accompanied by a SASE and mailed
to: KMRA Swapfest, P.O. Box 411, Waukesha, WI
53187-0411 General Admission - $4.00 ($5.00 at the
door)

NOVEMBER 1994

November 19-20, Sat.-Sun.: Fort Wayne, IN - Fort Wayne
Hamfest Sponsor: Allen County Amateur Radio Technical
Society (ACARTS) Allen County War Memorial Coliseum
Exposition Center Admission: $5.00 (No advance ticket
sales.) For information or table orders, send a SASE
to: ACARTS, P. O. Box 10342, Fort Wayne, IN 46851 or
call John Rufner at 219-483-6305 (table info) Don Gag-
non at 219-484-3317 (general info)

Nov 27, Sunday: Wheaton, IL - GMRS of Illinois May Fest
'94. Admission $5. Starts 8 AM. Setup 6 AM. Info,
call (708)690-1492.

COMPUTERFEST SCHEDULE

September 17, Saturday: Kankakee, IL - Computer Fest
1994. Sponsor: Kankakee River Valley Computer Users'
Group. Kankakee County Fairgrounds 9:00 a.m. to 3:30
p.m. Admission $4.00. Information: 815-935-8590 or
815-935-1605>

Computer Central, College of DuPAGE, Main Arena of the
Physical Education Building Park Blvd & College Road,

Not too long ago there was some discussion either here or in alt.radio.scanner about a mod which would greatly expand the number of channels one could program into a Pro-2022. Is this mod apocryphal, or does someone actually have it?

If it does exist, could someone _please_ let me know where I can get a copy?

Many, many, MANY thanks!

First off,let me apologise for not taking the time to lurk for
a few days before I start asking questions.
I have a PRO(!)37 which I just use occaisonally.I heard on one of the
other newsgroups that there were certain modifications that could be carried
out to 'enhance' the performance of this unit.I'm not asking for details just
yet,but if the mods would be of any use in the UK,perhaps somebody could let
me know by Email or whatever.
Many thanks ..

I haven't jumped on his case, yet. But if I were to, it would be because of
the possibility of harm from some especially loud feedback to someone
wearing headphones.

> Only channel 122. Ideas?

You're not allowed to lock out ALL the channels in a given bank - 122 may be the last one left active in bank 7. See if that's what's going on.

6534. Other Pro-34 Mods?

Newsgroup: rec.radio.scanner

Is there any other Pro-34 mods available other than cellular restoration and restoration of low FM band converage?

I am particularlly interested in a way to make the Pro-34 louder. Even at full volume it just doesn't get loud enough.

Thanks.

6535. Cannot lock out channel 122 on Pro43 ibid.

Another update. Despite the messages sent to me ascribing the phenomena to a boneheaded newbie problem, this channel 122 is NOT the last channel in the bank to be locked out. There are at least 4 other active channels.

However, there is a bug in the 43 that will let you lock out the last
unlocked out channel IF you are in program mode. If you accidently do
that, the only way to get the scan group back is the reset the scanner
:(

David
No, you have a regular PRO-2006A, the display switch label does read
"LIGHT" my radio is at home and I guess I don't pay that much attention
to the actual label on my 2006A. I just remember that the older 2006 is
labeled "DIMMER". My point with this posting is that there are still
modifiable 2006's for sale. The rumored 2006B may or may not exist
I just have not seen one in a store. Just because a sign says it's
new doesn't mean it's actually a new model of radio, it's just not
"Used" I guess. There is A LOT of mis-information going around that is
fueled by these rumors. Until somebody gets a 2006 that can't be
modified, it is just a rumor as far as I'm concerned.

Good scannin' to ya.

Message-ID: <thweatt.774566886@mustang3>
Source record: 271588

Are you interested in a scanner which will receive
everything from 100MHz to 1.8xxGHz? I am in the
process of selling this receiver made by ICOM (this
is a quality receiver). This radio was purchased since
I really wanted to see what was out on the radio waves
without blocking anything (this is continuous coverage).
This radio is in mint conditon and is only a year old
but I am now interested in other things. This radio
comes with all original (nothing missing) parts. The lowest
I will go on this receiver is $500 but I will consider paying
shipping and handling. This radio has never had any problems
and ICOM makes one of the best receivers around. If your
intersted just send me some email.

>channel 122. Ideas?

It's my guess that all other channels in that bank are already
locked-out. The Pro-43 won't let you lock-out every channel in a
bank. BTW, when I tried to lock-out everything and set all freqs to 0,
I somehow managed to kill the unit (blank screen, buttons inop, even
power cycling wouldn't help). The only way to restore it was the
general reset (hold down the 0 and clear while cycling power).

: Scanners can't transmit; what they intend to do is not illegal by FCC
: standards...

: The feedback idea, that will work...

: Andy

Actually, that is not quite true. My friend was a student at Cal Berkeley in the '70's and discovered that his original Bearcat scanner put out a rather healthy signal. It was strong enough to acquire the Berkeley Fire Dept. repeater. It also did the samething to the San Mateo Police Dept. repeater on 154.77 Mhz. They called the FCC about 'harmful interference'. We had quite a lot of fun for a while... range was over a mile...

I have found the drive thru freqs helpful as I drive the Interstate Freeway system. When I get hungry I punch the scanner bank with the freqs, check the display and see which one is at the next off-ramp... kind of a McDonalds detector...

Cellular phones transmit full-duplex to their respective cell sites much like cordless phones.

Tx (cell phone to cell site) 824.000 MHz - 845.010 MHz
Rx (cell site back to phone) 869.040 MHz - 893.970 Mhz

Keep in mind that your scanner should have a selection for 30 Khz steps. If it does not, it's not too much of a problem but it'll just take you much longer to scan the band because it will stop between channels if there's a carrier present. Your best bet is to scan in the Rx range because then. most times you can catch both directions of conversation.

In Canada, cellular scanning is still legal whereas in the United States, it is illegal. I repeat, against the law. I am not condoning nor telling you to listen, this is just some information on where others listen. Personally, if you're going to invest money in a scanner, do so soon because the FCC is getting down and dirty with all the manufacturers to make their units unmodifiable. A personal favourite is the Bearcat 2500XLT. The last of the greats !!

: I haven't jumped on his case, yet. But if I were to, it would be because of
: the possibility of harm from some especially loud feedback to someone
: wearing headphones.

Not a problem...
The volume is controlled by the wearer. The feedback would not be any
"louder" than the regular voice... the frequency (audio, not RF lets not
do *that* thread again...) might be a bit higher but is still in the
voice range...

It is actually more fun to keep the volume up just enough so that the
employee can hear themselves with the short time delay that adds a slightly
(but detectable) different quality to their voice.

As for lawsuits, at least one individual has been fined by the FCC
following a complaint by McDonalds when he decided to use his handi
talkie to chat back with the folks inside...

Talk about unclear on the concept...

Prank on, dudes...

Try 154.570 MHz. They generally use those Motorola radios, and the company sells (at Sam's, in fact) three different models with three different frequencies. I have no idea what they use them for, but other stores use them for communicating with in-store security people.

We had an incident here about six years ago involving a guy who was using his radio to threaten life and limb at one of our local McDonalds. He was finally caught. I was working at another local store at the time and I remember asking what the frequencies were at the time (hadn't become a "scanner buff" yet) and being told that they were being kept confidential (out of sheer paranoia). Looking back, I have have to chuckle at this since this info is so readily available and a matter of public record.

Stanford's life flight (it is not really Stanford's) has about 5 freqs in the
800MHz range. There is also a coordination freq that is 130.xxx that the helo
uses to talk directly to stanford. I could probably dig it up if you need it.

Cordless phones are pretty short range, so you're not going to pick up much, anyway. The best thing to do is look in the back of Police Call and get the actual frequencies. Just use the 46.xxx ones.

First of all, most of the newsgroups do not care for people who post from
anonymous sites. There is nothing to hide...

alt.radio.scanner came first and was "replaced" by rec.radio.scanner since the
rec. groups have much wider distribution. alt.radio.scanner lives on for the
simple fact that people still use it. You'll see many messages cross-posted
to both.

The AOR is a better receiver by far.

The R1 is acceptable for situations where size is of paramount importance;
like travel or covert listening.

I bought an amplified speaker from a mfr called "Naval" at a hamfest
a couple of years ago. It has a vox switch in it to conserve battery
life, and can also use nicad AA batteries or 12vdc. I used it both
on my ham handheld and my scanner with good results. I saw this
speaker in the AES catalog as well. Works well, but a bit pricy.

You'll find the 34 sounds much better with any decent external speaker.
This is true of the 43 and most other handhelds, 1.5" speakers just
can't make that much sound... I got a used GE external speaker from
a 2 way radio at a hamfest for $2, put a new cord/jack on it and it
sounds great on a handheld. Even the desktop units are much improved
by using a really good speaker on them.

Just sold my 34, had too many radios. It was a mistake, this was a
very good scanner. Much better than most and very useable. Good
overall performnace, IMHO. You can pick these up used for $150 to
$175, put a good antenna on them (I like the Diamond RH-77A) and
get better performance than most anything else on the market.

Regards,

From: DEVENNEY@VM.TEMPLE.EDU
Message-ID: <16FF896B1S86.DEVENNEY@VM.TEMPLE.EDU>
Source record: 271601

I have gotten reports of dealers getting high return rates on the
BC 2500XLT. One large scanner/swl dealer on the East Coast is not
stocking the radio any more. Can anyone comment on this or on their
experience with the unit?
I would also find any PRO-43 comments helpful. After hearing the
negatives on the 2500, I am leaning toward that model. Thanks.

Hmmm. Just a guess, since nothing else has helped: could that channel be
set as your priority channel? I don't know whether this would matter or
not, but ya never know.

Source record: 271604

John Hall recommended switching the -15db switch....

+++ATS0=1
Yes, John, I absolutely made the same mistake you did. Fiddled with the switch, and now reception is much, much better. Not as good as the 2021 was, but definitely can pick up most of the freq's it didn't before. Thanks for the tip!

One thing I did notice is that, unlike other synths, the 2006 makes 'white noise' (like an AM radio tuned to nothing) while it's scanning even when it's not on a particular channel (this happens no matter where the squelch is). It's rather disconcerting, but I can live with it. Does yours make the same noise?

Jeff Briskin

I would copy the material from my "Police Call" covering Tulsa
but it's WAY to voluminous.

When you get to Tulsa go to a Radio Shack and get "Police Call".
You will find tons of frequencies. I have always been able to
find them at the Radio Shack at Woodland Hills Mall.

Well, I think it would be hard to show that such was illegal. The person is receiving the signal, and amplifying the audio - which just happens to get picked up by the microphone at the trashburger joint.

The whole point is - they are NOT doing anything to the frequency itself. They are not transmitting on it - which is where the FCC would be interested. The FCC is not interested in what you do with audio signals - although they could conceivably come down on the burger joint - if the modulation went over 100%. Remember, it is the responsibility of the operator of the transmitter to control the audio content of the transmission.

It is also possible, if someone's hearing was damaged, that the person who caused the feedback could be sued - assuming that it could be proved. But, this would be a civil matter - not federal.

Well, another thing I do with the McDonald's frequencies is use my commercial radio (receive on the Inside-Outside frequency and transmit on the Outside-Inside frequency) and, of course using my commercial license, place my order through the radio. I'm also thinking about waiting one day until there's no-one at the front counter, and walking in and saying into the radio: "CAN I GET SOME SERVICE HERE!?!?"

That's legal with a commercial license, btw.

Yes, I beleive that the ECPA specified this particular 'service"
as one protected. Problem ahd been that those apragons of public morality
and righteousness, The Dominant Media Culture, had been "stealing" one
another's stories, traffic reports etc. By making it "illegal" to listen,
it gave the offended station some teeth to a complaint when the other guy
got caught. What a wonderful group of folks, eh?

oJust bought a BC 855XLT and am new to scanning.I like the unit but have
30 days to take it back in case I am not satisfied.Anyone out there had
any experience with these?Also,W
what is the big deal about cellular?Mine picks these up loud and clear
from 899.000 to 915.000.
Thanx in advance,
Steveo

But this doesn't mean a lower priority radio will get bumped off the repeater
if a police or fire radio keys up, does it? I have never heard this happen.
If this were the case, then all the lower priority radios would get bumped off
every time police or fire wanted to talk. Is there a way to enable this
priority feature from the radio? I seem to remember a Moto trunk system that
had a feature that the cops could switch on so that they had priority. This
was used only in emergency situations.

Good rig for folks who do NOT live in an RF-noisy environment.

Best feature: Auto Store (automatically stores "heard" frequencies into
specified databanks)
Worst feature: Susceptible to cross-modulation.

Other goodies: VFO control, 200 channels (10 banks), 10 priority
channels, Line output controllable by channel.

Brett Miller - N7OLQ (brett_miller@ccm.hf.intel.com) wrote:

: Sure it might be legal now to sell such kits, but based on the success of the
: cellular lobby, if companies started selling such kits, a law would be quickly
: passed to make these illegal too. I doubt any company would spend much money
: on a product that is destined to be outlawed.

Not completely true -- even a law against kits would not stop those
who sell it as pkg #1 - board, pkg #2 - parts, pkg #3 - plans, and
lastly pkg #4 - box to give it that professional look.

Even a law restricting scanner kits would not prevent it, as a board
(bare, unpopulated) is not a kit. A bag of parts is not a kit. A
box (without contents) is not a kit, and plans are in themselves, not
a kit.

Companies already do this with cable TV descramblers and speech
inversion descramblers!

Take a look at Ramsey Electronics -- They sell speech inversion
descramblers (which are illegal -- supposedly) as kits, they also
sell 800 mhz converters as kits too. I know, I have the speech
inversion unit and one of the suggested applications was the use
with a scanner! Of course, it was being advertised to be used
in pairs to scramble phone calls, but the instructions listed a
few other areas too!

Two other nice features are the optional CTCSS decoder & 30kHz tuning
step for certain 800MHz spectrum.

CTCSS-decode increases the useability in RF-dense areas, but of
course there are many freqs you'd want to monitor that don't use CTCSS...

6599. Difference between Scanner and CB?

Newsgroup: rec.radio.scanner
Date: 1994-07-20 19:49:25 UTC
From: rblaine@max.tiac.net
Message-ID: <30jv45$olu@sundog.tiac.net>
Source record: 271548

What is the difference between a scanner and a CB? I know that a CB is 2-way and a scanner is receive-only. But what about the channels? CBs only have 40 channels (integers 1-40) but scanners have unlimited channels (i.e. 248.836Mhz)? What are the frequencies of the 40 channels of a CB radio? (What is the relationship between a CB's channels and a Scanner's channels?) Why isn't there a "2-way scanner" type device? (I.e. one that broadcasts on something like 548.384Mhz instead of channel 33 or channel 28)

As you probably can tell I jsut got into this CB stuff, and am kind of clueless. Any help or explaining would be greatly appreciated.

Reply by mail if at all possible...

Thanks!

1. Satellite TV receiver
2. Akai cassette deck
3. Sony digital walkman
4. Ramsey AM-1 transmitter

1. Satellite television receiver- Mizushi PM-1000/PanSat BR-1000,
continuous analog tuning, C and Ku compatable, full subcarrier a
udio, ch. 3 or 4 tv output, audio and video baseband out, descra
mbler output, 625 lines resolution, low noise threshold, standard
950-1450mHz block, with manual. Bought new, was used for one week.
These receivers cost $229 new, I am selling mine for $150 or best
offer.

2. Akai single cassette deck, full logic computer soft touch cont
rols, digital level meters, left and right microphone inputs, hea
dphane jack, Dolby NR, MPX filter, home component design. Very ni
ce unit, works well, nice wood grain side panels. Price is $100 o
r best offer.

3. Sony digital AM/FM stereo walkman-radio only, tunes from 530-1
710 AM, 87.5-108.0 FM. Nice sound, inline volume control, local/D
X sensitivity control.
I paid $50 for this unit, I am looking for $30 or best offer.

4. Ramsey AM-1 AM transmitter- tunable to any AM broadcast band f
requency from 530 to 1700 kHz, nice toy for you
wannabe DJ's!
Range is a few hundred yards, but if you add a decent antenna sys
tem, I am sure you could get the range extended a bit more.
Fully assembled and ready to use, I am looking for $30 on this o
ne.

I am looking for a Realistic HTX-202 HT, and also a TNC for eithe
r a Commodore 64 or IBM compatable.
```

Please leave mail if interrested.
All above prices include shipping in the USA.

Thank you.

Anyone have any Milwaukee, WI freq's? I am looking for things other
than police/fire/med freqs. I have a low-end scanner that doesn't scan
freq's (a Pro-41) so getting frequencies is kind of guess work.

Thanks to the guy who posted all those McD's freq's.. I'm having fun
with 154.57... Anyone have any Burger King freq's? I used to work
there and know lots of gossip could be picked up.

Can a Pro-41 be modified to pick up airline frequencies (55-136 that I
can't get).. Also, how can I improve reception on a handheld unit such
as mine? What kind of antennas or adaptors do I need?
Thanks.

I've tried to do a bit of locating when I've received cordless transmissions
and they do seem to die out after only a few hundred feet (I've got a rubber
duckie on a Pro-37). Here's some info I've saved from months past:

--------------------------- begin included text -----------------------------

Okay, here is the whole scoop. There are 10 cordless phone channels.
Each channel has two frequencies assigned, one at 46.x and the other at
49.x. The 46.x freq is the one that the base uses to talk to the
handset and carries both sides of the conversation. Cordless phone
monitors listen to these. The 49.x freq is the one that the hanset
uses to talk to the base and carries only the local side of the
conversation.

Five out of the 10 handset freqs are also named channels A thru E
and are used by low power walkie-talkies, etc. Baby Monitors can
use any of these five, but generally hang out on only two of them.

So much for the text, on to the tables, class:

Channel Base Handset Alpha
1 46.61 49.67
2 46.63 49.845 B
3 46.67 49.86 C
4 46.71 49.77
5 46.73 49.875 D
6 46.77 49.83 A
7 46.83 49.89 E
8 46.87 49.93
9 46.93 49.99
10 46.87 49.97

A & E are the ones used by baby monitors.

: waiting one day until there's no-one at the front counter, and walking in
: and saying into the radio: "CAN I GET SOME SERVICE HERE!?!?"

: That's legal with a commercial license, btw.

Well... yes and no.
Yes, in that the 'commercial' radio may be FCC type accepted for the
application. And YES, if your commercial license authorizes you to
transmit on both frequencies.
^^^^

NO, if your transmissions are considered "harmful interference". It's a
thin line upon which your treading. Granted, that we're not talking
national security here, but you need to realize that with the popularity
of the programmable 'commercial' handhelds and the abuses that have
followed, the FCC has been taking a hard line when issues are brought to their
attention.

The 'harmful interference' is largely determined by the strength of McD's
complaint.

>

Hmmm . . .
I hear 880 and "The Nimitz Freeway" used interchangeably on KGO and KCBS, particularly when they're referring to the closures between Mowry and Thornton.

Sometimes, I hear 101 referred to as the "Bayshore Freeway" in traffic reports.

Never do I hear 280 referred to as the "Junipero Serra Freeway" on the newscasts. Too many syllables, perhaps?

However, the 101/880 closure in San Jose is referred to by numbers just about every time I hear about it.

Please forgive me...this is probably the wrong place to ask this, but it was the only place I could think of.

I was recently tied to a Motorola alpha/numeric pager. Does anyone know of any shareware for unix to send alpha messages to the pager? If not, how about a suggestion of what site I might look at.

Thanks for any help

Mike

I have an older bc100xlt which I don't use often. Recently I noticed
that the LCD Display looks like it has an ink stain along the top
edge. I assume its going bad. Can it be replaced or is there anything
I can do to stop further deterioration. Scanner works great.

6608. Need an antenna recommendation

Newsgroup: rec.radio.scanner
Date: 1994-07-20 23:39:57 UTC
From: dleon@seas.smu.edu
Message-ID: <1994Jul20.233957.6014@seas.smu.edu>
Source record: 271556

I have a small, portable device which broadcasts on NTSC UHF channel 14.
I am wondering what size antenna would be most effective for extending
the range. Currently I get about 100-115 feet range with a 4 inch whip
antenna. I'm wondering what size antenna would give me the max performance
from this little unit. Keep in mind that I need to keep this portable,
so I am hoping there is a max effective hieght, beyond which extentions
only provide marginal results.

Also, is there some sort of small booster which will bump the range up?
This project is for export outside the USA. The smaller, the better.

IT IS? What type of "commercial license" do you have? Do you have a station
license for these frequencies with a call sign? What type of equipment are
using? Is it type accepted for use as an intercom?

Just curious.

>channels (i.e. 248.836Mhz)? What are the frequencies of the 40 channels
>of a CB radio? (What is the relationship between a CB's channels and a
>Scanner's channels?) Why isn't there a "2-way scanner" type device? (I.e.
>one that broadcasts on something like 548.384Mhz instead of channel 33 or
>channel 28)

Scanner is just a term for a type of receiver used to scan a number of
selected frequencies or channels. If it were two way it would be transceiver.
Many transceivers can be programmed to scan a number of frequencies, or
channels. So yes, in a way, there are two way scanners.

Your CB channels are at the upper end of the high frequency (HF) spectrum.
The channel number is just a set standard representing a certain frequency.
CB channel 1 is 26.965 MHz. Channel 40 is 27.405. The others fall in between
those (most are in order) with 10 KHz (.010 MHz) spacing. Most scanners will
not work on freqs this low.

I have found that in the stores where the headset is on 156.4, you can hear both sides on 35.02. In the stores that are new (last 2 years or so, they are on the UHF freqs posted here about a week ago.

BTW - a friend of mine who is an engineer for Motorola tells me that KMART security can be heard on the 46x.xxx freqs and the conversation should be quite interesting...he will try to get them for me and I will post when I do.

6614. ICOM R1 NiCd battery

Newsgroup: rec.radio.scanner
Date: 1994-07-21 00:29:09 UTC
From: jcupples@iphase.com
Message-ID: <jcupples-2007941629090001@157.175.110.24>
Source record: 271551

The NiCd internal of my R1 is getting wimpy. I figure to take it apart and solder in a new one. Called ICOM in WA, and they want too much. Anyone done this, can I use some generic battery rather than the ICOM part? Already have the 6AA convertor, but occaisonally I like it to be really tiny.

(not listening to anyone who tells me I shoulda bought a RS instead)

cheers

Jerry (jcupples@iphase.com)

Source record: 271568

Aside from the inventory transmitters in the UHF range,
the closest K-Mart store to me uses 154.6 MHz for an in-store
radio/intercom, complete with telephone patch.

Across the street from K-Mart is a McDonalds also on 154.6 (and 35.02).
Up the same block is an Ace hardware store on (you guessed it) 154.6 MHz.

Both 154.6 and 154.57 MHz are programmed into all my scanners because there
is always something happening on those frequencies.

I thought it was against FCC regs to use cellular telephones
from aircraft because the phones tend to "hit" several cell
sites at once and reduce the total number of available
channels. Or something like that.

6618. Uniden 890XLT or 8500XLT

Newsgroup: rec.radio.scanner

Source record: 271572

I'm planning on purchasing either the 890XLT or 8500XLT. I'd appreciate info on a comparison. Does the 8500 allow AM/FM and step modes to be switched regardless of the freq range? I know the 890 doesn't. I'm also aware they are not cellular restorable. I've read the recent post on the 890 so I'm hoping someone has gone through a similar comparison and the jsutifications of each. My main interest will be scanning the military aircraft traffic here in Maryland. Thanks in advance...

Andy

6619. Yes, you CAN receive 500-512+ Mhz on your Yaesu FT-530 !

Newsgroup: rec.radio.scanner
Date: 1994-07-21 02:40:42 UTC
From: srhoades@netcom.com
Message-ID: <srhoadesCt9rFv.C8z@netcom.com>
Source record: 271573
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

So here I was the other just sitting, minding my own business, when I discovered the following trick to receive 500-512+ Mhz on the FT-530.

On the UHF (right side) vfo, put 499.975 in the "L" memory.

Put 800.000 Mhz in the "U" memory.

Make sure that when in the Memory Recall mode, this channels are NOT set to be skipped.

Recall channel "L".

Press MR once. (Three little dashes should appear under the "L".

With the squelch closed, press the "UP" arrow key.

Happy scanning!

Most of the normal scanning functions will work. And, you can write the displayed freq. to any memory location.

Some purists might be saying, "just because it displays a certain freq. doesn't mean it actually receives it...". Granted, the sensitivity isn't the greatest but I can hear LAPD on 506 Mhz just fine.

I'd be curious to know just how far up you can go before the VFO unlocks.

Some of you 220 Mhz folks might be wondering if a similiar trick could be done on the VHF side vfo to receive 220 Mhz. Well, you can get the display to show 220 Mhz but I suspect the vfo is out of lock since the display blinks.

Btw, the radio I am doing this on has had the extended VFO mod done. I don't know if this makes a difference.

Now if I could only find a way to receive 40-54 Mhz....

I have a PRO-2021 200 channel mobile/base scanner with tape output, AC/DC
power operation, Motorola external jack for external antenna. LCD
backlit display, Priority channel set, delay, full searching functions,
recieves the usual and aircraft (sorry guys, no cellular on this one),
solid metal case (no plastic) and no intermod problems (at least where I
live). Reception is great and the speaker volume is very loud! No
external speaker needed, however there is an external speaker jack in
case you want to hook one up.

Radio has absolutely no problems and I have the owners manual and tons of
Federal Government Freq Sheets (all the ones you would want). I am
asking $125.00 firm for the unit and I will pay the shipping anywhere in
the United States. If outside the U.S., I will let you know the cost
with shipping.

Only serious buyers need reply.

Thanks,

Jay Goldberg

I suspect he means the normal tricks to getting back the range do
not work as the processor limits what it will scan (range-wise).

What's the cost of a new processor (from an INTERNATIONAL version)?

You can still get these overseas and Canada without any problems...

Those are TRUE continuous range, not the censored U.S. models.

Boycott the U.S. dealers until they find a way of carrying the same
product you can buy overseas or in Canada with FULL coverage. Until
then they do not deserve any business.

If EVERY dealer and the manufacturers were to band together, making
the cellular capable units as well as importing them from overseas,
perhaps in modules and assembling them here, there is NO way the FCC
could stop it.

Personally, I'd like to see the FCC DISBANDED. They are a bunch of
overpaid idiots.

NM>Well, another thing I do with the McDonald's frequencies is use my
NM>commercial radio (receive on the Inside-Outside frequency and
NM>transmit on the Outside-Inside frequency)
NM>That's legal with a commercial license, btw.

I was wondering what type of commercial licence would allow you to use any frequency you choose? Do you also identify your self with your FCC call sign? I have a commercial license but that does not mean I can transmit on any frequency that I want to. If you are legally licensed to transmit on these frequncies what kind of business are you engaged in that you were able to be licensed? They just don't hand them out for the asking. Also, I would be very upset if NABER were to have asigned me frequencies that were already in use.

I am betting that you own a 2 meter radio that has been modified for out of band transmision, not a FCC type accepted radio and are transmitting illegally. Am I right Nicholas?
Just for curiousity I am going to see if anyone with the name Nicholas McLarty has a license.

Don't worry, I,m not going to turn you in. But I would be carefull!

NMH batteries have a very fast self disharge. I had some in one of my Icom
HTs and the batteries would be dead after the radio sat for about a week
unused. NMH is not the "super battery" it was made out to be. NMH works fine
in cell phones and laptops because they are always being used.

Jerry,

Unfortunately, ICOM and most companies sell us equipment w/consumer rated ni-cads. I'm a comm's system design engineer and I use commercial rating batteries that have a substantially higher current rating than their commercial equivalents. I've started replacing my ni-cads at home w/their industrial equivalents w/great success. It'll take a little longer to recharge and are more expensive but I think the price is worth it.

Call Sanyo at the folliwing numbers for their product catalogs and find the equivalent for your battery (same size, but much higher current rating) and place your order, youll be pleased w/the results.

Actually, don't blame the FCC. The FCC was mandated by congessional
legislation to develop and impose the cellular scanner restrictions
that became effective last April.

Just a point of reference to keep in mind.

>
> Bob Hamilton (rfhamilton@vnet.ibm.com)

Bob

I HAD an R.S. discone on my roof and it's performance is abysmal below 100MHz. Besides that, the radial elements are very fragile because the hollow elements have a threaded insert on one end so it can be screwed into the antenna. If I ever took down the mast I invariably broke a radial in the process. I gave up on it and bought a Diamond D130J from Grove. I have been very pleased with the D130's performance. I pick up about 20dB more signal at 50MHz over the R.S. discone.
If a mediocre performing and fragile antenna is good enough for you, then go ahead and buy the R.S discone. I sold mine to a friend for $25 (Although he had to buy two radial elements from Tandy parts center to fix it) and it's "Good enough" for his use. He can't put up an antenna outside, so the lack of a vertical element on top allows it to fit inside.

The discone is a good, general purpose, VERY wide bandwidth, antenna offering some gain on all freqs. It does this by compressing the radiation pattern into a donut shape with little of the signal radiating upwards or downwards, concentrating the patten perpendicular to the vertical axis of the antenna. We use discones on all our ground based Military UHF comm and data links that we build here at work for the 225-400MHz band.

Good scannin' to ya.

Most of the radios are half-duplex, they can't hear while talking. That
means the radio CAN'T be told to stop transmitting! The priority applies
to the NEXT available channel. The 'emergency' signal goes over the control
channel and should be available to the dispatcher but that still doesn't
mean she would be able to get a channel to tell everybody else.

That's funny!! I have a bc200xlt with ink stain along the bottom. The
display still works but the receiver is dead. I think the receiver power
regulator is bad.

I also have a PRO-37 I've had for a few years and have had no problem
with it at all.

: The freq. I was trying to lock out was 161.7 MHz, on which was a
: dead air carrier noise of some sort. Not a birdie.

161.7 is a broadcast RPU (Remote Pick-Up) freq. Very well could have had a dead carrier on it. You should be able to call just about any radio station in your area, ask for the engineer, and ask if they know whos on that one in your area, or ask for the name of the Freq Co-ord in the area.

Many times these channels will keep a dead carrier on them as they are used in a repeater setup or as a back channel.

Did they re-layout the board when the went to the new ones or is it the same
circuit board with new software and the diodes moved around? If the board is
the same you could probably copy the processor code from an old pro 43 into
a new PROM, move the diodes to the appropriate places and solder in the PROM
with that old code. It involves a lot of delicate soldering but could it
work?

My thanks to all who responded ... UseNet and E-Mail. Leaving this weekend with scads of frequencies to try and all my radio gear packed. Hope the folks at the airport don't think I'm a terrorist or a spy. Can I get Net Access from Federal Prison?

Robert

So how does this prevent you from locking that channel out? I can lock out channels that have nothing on them, or that have a carrier and no signal, or that have carrier AND signal. The content of a channel *should* have no effect on your ability to lock it out.

This stuff is interesting on its own, but it won't help the original poster with his question.

Sorry for the long post. But I thought a reply would be nice.

YES! Do an archie search for EXPECT. This is an awsome utility for
UNIX systems.

From the man pages:

EXPECT(1) USER COMMANDS EXPECT(1)

NAME
Expect - programmed dialogue with interactive programs

SYNOPSIS
expect [-dDinN] [-c cmds] [-fb] cmdfile] [args]

INTRODUCTION
Expect is a program that "talks" to other interactive pro-
grams according to a script. Following the script, Expect
knows what can be expected from a program and what the
correct response should be. An interpreted language pro-
vides branching and high-level control structures to direct
the dialogue. In addition, the user can take control and
interact directly when desired, afterward returning control
to the script.

Script to call paging service.

#>Does anyone have a program that works on BSD that will connect to a device
#>dial a number and transfer Alpha Pager Message via the IXO for alpha pagers?
#
#I have an expect script (actually, two files) that does this. It can
#use tip(1) to actually talk to the modem. We also have a different
#module that telnets to an terminal server with dial-out modems too,
#that just uses a different "hardware" file.
#
#This pretty ugly and disgusting, but the implementation of the IXO
#protocol in TCL, I thought, was rather interesting.
#
#It's usually invoked as
#
# beep pagerid "It's broken! Help!" pagerid2 "Help! It's down!"
#
#there's also a way to pass it a file containing pagerids and messages for
#"bulk" beeping.
#
#Louis Mamakos

Over the air programming is available but it is more likely that a control
operator / dispatcher patchs the groups together. This still keeps the
conversation on the same cahnnel pair. The trunked central controller
handles the connections. Remeber that all radios on the system should have
access to all of the channels.

The system would only bump the lower priority user if there are no available channels. The emergency button can be programmed to do a number of things on a system. Mainly used as a man-down feature (though most man-downs are automatic if you want them to be really effective), pressing the button will identify the radio on a display at the dispatch console.

It is not an encoded file. It is plain ASCII, so if you downloaded
it as BINARY, download again as ASCII and type it to the screen.

Hi Brett (& others),

I could be very mistaken, but I'm sure that I read that the
software would handle the recording without any special
hardware, other than a multi-media sound card. The mag was
found in Barnes & Noble, I'll have to see if it's still there.

Bryan.

>800MHz range. There is also a coordination freq that is 130.xxx that the helo
>uses to talk directly to stanford. I could probably dig it up if you need it.
[...]

The 800 band freqs (rounded to nearest KHz for scanner entry) are:

854.012
852.287
858.312
854.062
853.787

These are not trunked, they are individual repeaters. They apparently share the repeaters with other commercial users. I have heard them often on the first one. The air-band frequency is 130.050 (AM). This is a generic helo coordination frequency where you might also hear CalStar and others. The medical helicopters are most often heard on the the VHF Fire White 1 channel talking to the ground fire units. This frequency is 154.280.

Have fun!

6666. Morse Code

Newsgroup: rec.radio.scanner
Date: 1994-07-22 01:06:34 UTC
From: pjacobs@netcom14.netcom.com
Message-ID: <PJACOBS.94Jul21180635@netcom14.netcom.com>
Source record: 271514
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Periodically, when I scan the police and fire frequencies around
460-480 MhZ, my scanner picks up brief transmissions in Morse Code.

Does anyone have any idea what these are? I'm in the SF Bay Area.

Thanks in advance,

Peter J.
pjacobs@netcom.com

6667. Re: GAY/LESBIAN/BISEXUAL HOBBYISTS - Let's END this shit!!!

scanlock@delphi.com wrote:
: Boycott the U.S. Dealers? They're just obeying the law when they have to
: sell you cell locked out radios. Congress gave you the law, after they were
: well paid by the cell phone companies. Why not direct your ire at them?

That is because the U.S. Dealers (including Radio Amateurs) did NOTHING to stop it. I have not seen anyone fighting this in court! I have the RIGHT to own, possess, and import if needed, an INTERNATIONAL receiver as I travel to other countries from time to time where full coverage is needed due to frequency allocations being different.

This "action" now REQUIRES that I import such equipment as I can no longer readily obtain it here.

I learned something about American Business -- it takes a loss of business to encourage a business to take action. Ie, if they show losses in sales, and they know its due to people NOT buying the U.S. scanners because they are junk (ie, NOT continuous, NOT international models), then they will band together to fight this thing.

I encourage everyone to refuse to purchase scanners which are not modifiable.

Now there are several ways in which exceptions could be made to this suggestion:

[1] U.S. Scanner Dealers indicate to manufacturers they have a problem -- sales are down. They show messages to support the fact its a boycott of U.S. made scanners due to the lack of "international" capability, not being full coverage.

As a response, the manufacturers include serial capability in their new models and a diskette which can be purchased AFTER the scanner has been FCC certified. The section dealing with easily modifiable suggested the addition or removal of component(s), and directly mentioned hardware in the description of readily modifiable.

This disk could have unlock code to add international capabilities to the scanner (ie FULL 800 mhz). This would get around the lousy law making this needed. Since it would be AFTER certification and the scanner as sold over the counter is NOT readily modifiable in hardware (ie needing the disk and computer, not part of the package as sold over the counter), this is a legal way around the law.

[2] U.S. Scanner Dealers indicate as above the problem, and the manufacturers obtain certification with the cell stuff locked

out in a CHIP (perhaps a simple gated chip, when present it is locked out). Possibly and AND gate, and when replaced with an OR gate, it would permit cellular. Sell the scanner as one item, the simple single CHIP for replacement as another.

This is not adding or removing a component, this is replacing a chip -- which could be done presently in most of the newer scanners, just by replacing the microprocessor. Note, the FCC is happy about that part, but it too should not be accepted as it could be fixed by removing the old cpu and adding a new cpu (ie adding and removing a component -- THE CPU!!).

Under this terminology -- NO scanner should be considered acceptable -- as any could be changed. I mean, all it takes is removal of parts specific to US model and replacing them with parts used in the international model. The law does not cover PARTS.

[3] Basically, we need to give the manufacturers reasons to bag the parts, put a sheet of instructions in (plans) and sell them along side the scanners. That is the point I am making.

[4] We need to show the manufacturers they need to fight this, they need to get together, get the best lawyers in the country and go to court. As in item one, I learned American Business needs to show a loss of business to see a need to take action. Showing the manufacturers that ONLY their international products are prospering will cause the U.S. Dealers to scream foul. That will interest them in taking action to REPEAL the law.

Personally, I could care less about it. I'll listen to cellular when I d*mn well please, I will import whatever, whenever I need to, and no one will stop me. The bottom line is if the U.S. Dealers and Manufacturers will not stand up and IGNORE the law, I will -- by going overseas and Canada for my scanners. I would like to invite others to do the same as well.

What I do NOT like about this is the d*mn taxes & duties!

When is the NORTH AMERICAN FREE TRADE AGREEMENT between Canada and the U.S. supposed to take place? It is my understanding it will remove duties on goods travelling between the two countries. This should also remove the requirement of goods going through customs as well (which means even if there were legal grounds to stop these scanners entering for reasons of possession instead of use as the law was worded), they would not be checked, so they could not be stopped.

If this NAFTA agreement is what its made out to be, everyone will order their new scanners UPS Red from Canada and pay nothing more than the current price at the Canadian Dollar plus the small fee for shipping it.

BTW, when all of you buy your scanners from Canada and Overseas,
use your MasterCard (Access) or VISA (BarclayCard) to pay for it,
as you will receive a better exchange rate -- just a tip of an
experienced importer (of personal items).

Show your middle finger out to the FCC/Government, REVOLT!

6669. Re: M-400 Multimode Decoder Output to Computer

Newsgroup: rec.radio.scanner
Date: 1994-07-22 02:18:13 UTC
From: steven@sgb.oau.org
Message-ID: <CtBL2E.KBz@sgb.oau.org>
Source record: 271379

Joseph Jesson (joe@netcom.com) wrote:

: The M400 is a great decoder for lots of digital formats and the
: price is reasonable. My problem is the NO UPGRADE policy for the M400!!
: If you are talking to Universal, or your favorite dealer, bitch about
: the lack of upgrades. The reason why I am upset is my M400 will decode
: 512bps POCSAG but not the newer 1200 and 2400 POCSAG and will not upgrade...

I spoke with the folks down by Sarasota that make the unit for
Universal. Here is what they told me:

[1] There is no upgrade available at the present time.

[2] The newer model has been available since January of this year.

[3] They will be releasing an upgrade package of replacement
EPROM(s) later this year to upgrade the older units. Cost
was not determined as of yet. I was told it would be better
to wait than sell old unit and buy a new one.

[4] There is a concern about memory and the LCD display. The
memory was increased (scroll region) on the newer units.
This was due to the higher speed of the data being lost too
quick. They indicated if it is used with a parallel to
serial converter and computer, it would not be an issue.

[5] Only the EPROM change would be needed to upgrade.

So. The question is, does anyone have a new version 2.0 unit and
a EPROM reader/programmer who could dump the contents of the chip
into a file, make a text file with the chip type/number needed and
ship me the hex file and text via e-mail?

If some kind soul wishes to do this, I will report back the findings
of the new firmware in an older unit.

If the hex file is larger than 50K, please split it into parts and
do not forget to number them in the subject field (someone once
did this with some other code and forgot that vital part! All
hex characters look the same!)

Thanks much in advance for anyone who's willing to do this.

Steven

6670. Re: Exactly where are cellular frequencies

Newsgroup: rec.radio.scanner
Date: 1994-07-22 02:33:11 UTC
From: rdsnyder@ATHENA.MIT.EDU
Message-ID: <30nb57$52n@senator-bedfellow.MIT.EDU>
Source record: 271515

A company called NexTel bought up huge numbers of SMRS licenses to construct a hybrid trunked landmobile/cellular network. I got a chance to play with their transceivers while helping the Red Cross in the aftermath of the L.A. earthquake. Very Cool. They look like cellular or trunked landmobile sets, but have 3 buttons to select the mode. The first mode is a generally-broadcast repeater-style landmobile mode. A message is transmitted to all of an organization's units. In the second mode, which is a point-to-point landmobile mode, communications are directed only to a specific unit, allowing long-winded messages without tying up all stations. The third mode works just like a cellular telephone.

The person who wonders what cellular-like communications they are hearing on their new 37 CFR 15.121 compliant scanner at 865 MHz may be hearing these pseudo-cellular calls on SMRS channels. Alternatively, they may just be hearing intermod or mixing of real cell calls with other signals, either internally or externally generated.

Here in Virginia (both Eastern Tidewater and Western Roanoke Valley area), the med helos have digitally programmable radios. The helo can xmit/recv on just about any freq in the VHFlo or VHFhi band, which is where most of the comms take place around here. This lets the helo fly into the next county over and still communicate with not only its home base but also with any department on the ground in the LZ.

I posted a similar request a few months back for personal experience of using the FOIA to get freqs from a state agency (the cops in my case), but got mainly suggestions of why they wouldn't want to disclose the freq. info.

I'll reiterate and ask again, as Ken has above, has anyone actually had experience and/or success in wielding the FOIA to get freq. info? I'm sure the netters in general would be appreciative if you could shed some light/suggestions on the subject.

Also, in a post by Glen Roberts, he mentions quoting the code sections et. al, which is a good place to start: does anyone have the FOIA acrhived somewhere in their computer files that they could post?

Currently there is a young boy (~10-12 years of age is my guess) lost
in the Great Smoky Mountains National Park. His family was visiting
Clingman's Dome on the border of NC and TN when he was discovered to
be missing. Does anyone have any frequencies for the GSMNP? (OTHER than
those listed in Police Call?) It's been about three days that the
boy has been missing and tonight I heard on the news that they are
planning on utilizing an Army Helicopter with IR (or was it UV?) search
capability to search through the night. Anyone know what frequencies
I should search with my PRO-4006?

TIA,
Paul

: Does anyone have any idea what these are? I'm in the SF Bay Area.

My guess is that the morse code is the repeaters identifying themselves.

I believe that it is an FCC requirement that all repeater stations
periodically identify themselves. If you listen to ham-band repeaters,
occasionally you'll hear a digitized, pre-recorded, or computer-synthesized
voice identify the repeater station. Something along the lines of:
"This is WX72G, repeater" (I made the call sign up)

Guessing,
Paul

Message-ID: <30ngmv$l74@lambada.oit.unc.edu>
Source record: 271521
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The local Roses store is going out of business, and everything in the store is at least 50% off. I finally bought some battery packs for cordless phones, rated at 500mAh and 3.6V each. I soldered two packs in series, so I now have a single 7.2V 500mAh pack, with which I would like to run my Uniden BC100XLT when the main battery runs down (such as in extended power outages, etc).

The main (original) battery pack is rated for 600mAh, 7.2 volts. My question is, Will the current supplied by the new pack be sufficient to run the scanner without any problems? I realize, that because it's only rated for 500mAh, that its life will be notably shorter, but ought to still provide several hours worth of scanner usage.

Should I go ahead and invest in more of these packs? They still have a bunch (anybody interested in buying some?), and total cost for the 6 cells is something around 11.00, much cheaper than the Uniden battery pack cost. If I can duplicate the charger circuit, then I'd like to keep a supply of backup battery packs for outages, etc.

Here's the real focus of my post (since I already have some pretty good ideas on the possibilities and methods for doing the above): Is anyone familiar with the L4810CV 3-pin TO-220 package IC? In the schematic, they show the input voltage from the charger to be 13.8V, and the output pin to be 10.0V. Is this critter a simple, easily substituted 10 volt regulator? If so, then the rest of the circuit is easily reproduceable (no overcurrent limiting, etc: It seems to be a simple noise- and reverse polarity-protected circuit designed to both power the scanner and charge the batteries).

If it's not a simple voltage regulator, but in fact does have current-limiting etc. built in, then would it damage it to switch the original pack out and the new pack in its place? Or possibly to connect both packs up to the charger at once?

I can provide further details about the charging circuit if needed.

Yes, in our area we have multiple real-time stock and newsfeeds
digitally encoded on subcarriers.

Some are FSK, others ASK, all tough to decode....

Dave,
I downloaded the same file from the same place. I believe it is
just a straight ascii file that can be TYPEd out. However, when I
got it, I read it directly into Microsoft Word.

No manuals. I just popped off the back, and from reading the description of
the mods I downloaded from somewhere I figured that the row of diodes must
be fairly close to the bottom edge of the third board, so I checked to see
if they
are reachable. It took a bit of patience and a decent microscope to see
in, but the
location of the diodes was easy to see and a thin knife (ala X-acto) could reach
the solder points.

>>one that broadcasts on something like 548.384Mhz instead of channel 33 or
>>channel 28)
>>Russ:

Remember that radio takes on many different shapes and forms. For example FM, AM, PM, A1A(Morse Code). A CB radio operates in the 28Mhz range on preselected CHANNELS. Channels are Numbered 1,2,3,4, etc for a purpose. The frequency looks like this:28.795Mhz.

You have to program a scanner and tell it what frequencies to put in each of it's channels. Most scanners operate in an FM recieve mode. Your local police dept. cordless phones, mcdonalds, etc.... all operate (with few exceptions) on higher FM frequencies (153.555 or 453.825 or 853.38) Notice that these freq.'s are much higher than CB.

Jeff, KE4AUT

P.S. They do make radio's that transmit on these frequencies(I have several). If any of this interests you, send mail to HQARRL@aol.com., and ask for a ham radio introductory package.

>a week or two back someone posted a letter stating how
>you could possibly restore the cellular range for the pro46.
>

Okay, here goes.....

NOTE: THIS WILL WIPE OUT ALL STORED FREQUENCIES ON YOUR SCANNER!

Hold down the 2, 9 and L/O (lockout) keys as you power up
your scanner. This will load a set of test frequencies into
channels 1-25. Channel 23 in in the cellular range. Store this
frequency in one of the monitor banks channels and re-program
your old frequencies. Use the frequency stored in the monitor
bank to manually scan up and down through the cellular band,
and store some of the "hits" into your regular channels.

If none of this makes sense, email me and I'll try and explain
it better.

I've been enjoying this debate about the uses/merits
of trunked comm systems.

Just wondering if any one out there has composed a faq on
trunking, how it works, info on the different systems. I
guess I'm after something a little more technical and perhaps
system specific to GE, Motorola, etc. systems.

Dunno, any thing like this out there?

Steve,

NAFTA already in place, the increasing un-employment figures in the
manufacturing sector verify NAFTA's 'success'. There are many loopholes
that NAFTA can work into. The same regulations that apply to
US made products apparently don't apply to these imported items if the
NAFTA countries claim they do (ie; if Mexico says product complies to
supposed standards and they don't, US has no authority to prevent import).
I won't get into the one sided politics of the agreement, if you're
interested you can ftp the NAFTA agreement using WAIS.

BTW, have you any phone numbers of Canadian dealers that will ship to the US?
Share them with those interested, please. ITMT, I'll use my converter
I bought a few months before the communist law went into effect with any

new scanner I purchase.

Before any of you high and mighty self righteous folks flame me, why hasn't the FCC come down on manufacturers or dealers that sell radio transceivers that can be modified to transmit any where in the RF spectrum? Certainly this is more severe than harmless cellular receiving?

Oh, BTW, the US security agencies still can aquire continuous coverage receivers to monitor YOUR cellular phone calls. Nothing like the government saying 'do as I say and not as I do'...

Andy

6700. CHP<->Police Conversation

Newsgroup: rec.radio.scanner

I heard an interesting conversation this morning while listening to my trusty PRO-34. I was monitoring the local CHP frequencies (Golden Gate) along with the local sheriff's dept. frequencies. At one point, I could hear both sides of conversation where one end was a sheriff deputy in the field, and the other end was, I believe, CHP dispatch. Apparantely the CHP had stopped a vehicle that had been reported stolen to the sheriff's dept. They were trying to verify the vehicle and the driver. The strange part was hearing one part of the conversation on a sheriff frequency and the other half on a CHP frequency.

I thought the tricks needed to program above 500 were pretty well known,
but apparently not. I found the instructions appended to one of the FT-530
modification files that float around the various FTP sites.

In any case, my 530 happily locks on the UHF side well up into the 800s,
picking up PECO Energy (AKA Philadelphia Electric), among others. I'm sure
it could pick up cell phones, but of course that would be illegal, so I
would never personally do it. The only slight problem is the enforced 12.5 kHz
step size.

Have fun with it!

>Clingman's Dome on the border of NC and TN when he was discovered to

Being somewhat familiar with that specific location (I've
run some Amateur Radio from up there), I can say that if he just
got out on one of the trails, he'd likely have been spotted by other
hikers by now. The Appalachian Trail runs right smack through that
specific area, plus a bunch of other hiking trails that are fairly
well-used this time of year.

>be missing. Does anyone have any frequencies for the GSMNP? (OTHER than
>those listed in Police Call?) It's been about three days that the

If I had to guess, I'd imagine by NOW (after several days, that is)
that most of this communications will have moved OFF the park service
freqs. and onto whatever freqs. are used by the other agencies that
are involved in searching. If the Army comes in with InfraRed (IR)
night gear, you'll want to dig up the Army SAR (Search And Rescue)
frequencies. I *think* they utilize frequencies on several different bands,
there might be some stuff in the 30+ MHz range that I recall seeing.

(it sticks in my head it was around 33 MHz but I might be wrong
about that.....)

I don't recall for sure, but there may be an area CAP (Civil
Air Patrol) chapter that could conceivably get involved. They run
some comms. around 148 MHz, just above the high end of the Amateur
2-meter band. Even a 10 year old could conceivably cover a lot of ground
in 3 days, depending on his physical condition. How he does at that
altitude is another matter. I might not be remembering correctly,
but I think a lot of the trails right around the summit are not
real heavily tree-covered, so visibility from the air may be better
than at a lower altitude. The summit at Clingman's is something
like 6643 feet above sea level, which means any trees that are that high
up tend to be evergreens - pines, firs, etc. and thus not as "thick"
as the deciduous trees at lower altitudes. That may be helpful if
he hasn't gone too far down-slope.

If he HAS gone downslope and stays *ON* the trails, there
is also a good chance he might bump into a small campsite someplace;
there are some around there but with my maps I can't say how far and
in which directions. The park people will know that.....

If some of the area hiking clubs or other volunteers are out
there looking for him, they could use:

1) amateur radio, probably 2-meters 144-148 MHz

2) CB

3) that new-fangled GMRS thing...is that a 400-something or 800-something
band? I don't recall.

4) some folks might even be carrying 49-MHz headsets for strictly local
coverage (if they aren't going to be separated very much) although
this is a low-percentage idea.....

****

I sure hope they find him OK. Having walked a lot of those trails, I
can guess that a 10 year old could get pretty frightened at night......

Duane

Chris Best came off saying that::
: > Many times these channels will keep a dead carrier on them as they are
: > used in a repeater setup or as a back channel.

: ----------

: So how does this prevent you from locking that channel out? I can lock out
: channels that have nothing on them, or that have a carrier and no signal, or
: that have carrier AND signal. The content of a channel *should* have no
: effect on your ability to lock it out.

: This stuff is interesting on its own, but it won't help the original
: poster with his question.

True, I did post a reply to that question stating that I had the same
problem with my pro-2022 (same chip set I think). I guess that it got
sent to /dev/bye-bye. We've been having problems with news but things
will be getting better RSN. Anyhow, my lockout problem went away after a
month or so, don't ask me why, I'm not going to dig into the code on the
cpu and try to figure it out (unless tandy is willing to pay).

: I sure hope they find him OK. Having walked a lot of those trails, I
: can guess that a 10 year old could get pretty frightened at night......

: p.s. let us know how it turns out, ok?

The boy has been found.

Three days ago, the boy and his parents were visiting Clingman's Dome
in the Great Smoky Mountains National Park. While headed back to
the parking lot, the boys parents noticed he had wandered off the trail
and they assumed he would return to the trail and meet them in the
parking lot.

While he was off the trail, he somehow lost his way. He came across the
Appalachian Trail, which he followed for a while before veering off into
the woods... thereby, becoming totally lost.

For three days and three nights the boy was able to find water and shelter
to keep himself from being dehydrated or sucumbing to hypothermia.

He was found earlier today (Friday) about 2.5 miles from Clingman's Dome.

All this information is from a Local Newscast. According to the
newscasters, he was in good spirits and health.

Wish I would have started searching for freq earlier in this ordeal.
I would probably be able to provide y'all with more information.

Keep scanning,
Paul

Tim didn't mess up his rig, he just didn't bother restoring the 54-88MHz
which doesn't come in the USA version of the 43 in the first place. Some
people don't care about that band because it's mostly TV audio(WFM), and
the 43 (USA version) isn't tuned to be sensitive in that area. But you
can modify the 43 to receive that band (although it's less sensitive there).
As you know, removing D4 restores Cellular. Taking that diode and

soldering it to the empty set of pads for D3 restores 54-88MHz.
TV: Chan.2=54-60MHz, Chan.3=60-66MHh, Chan.4=66-72MHz, Chan.5=76-82MHz,
Chan.6=82-88MHz. The audio will sound distorted, but understandable.
Utility Band: 72-76MHz=Pagers, Radio Astronomy, some Public Safety
repeater relays, and Aeronautical Navigation.
I got my info through Commtronics Engineering World Scanner Report - PO
BOX 262478 - San Diego, CA - 92196-2478. *GOOD STUFF*

Source record: 271424
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Alright, I admit it, I'm a dreaded newbie. I've been trying to follow the discussions about some of the better equipment, and I'm thinking of buying one of these:
- Icom's IC-R1 (no SSB[?], .1-1300MHz, full continuous)
- AOR's AR1500XLT (SSB, .5-1300MHz, 1000 ch. continuous)
- Trident's TR2500 (SSB, .1-1300MHz, 62 ch/s, CPU controllable)

I want to do a variety of recieving with whichever I get, but I'm concerned
about the _quality_ of the recievers. Just starting out, I have no idea. I've heard that the IC-R1 & AR1500XLT are very good, but haven't heard anything about the TR2500 and was mainly intrigued by wanting to have some CPU control; I was hoping one of the tasks I would be able to do with it is
some form of automated RTTY'ing (Weather Faxes, Morse, etc.). Mind you, portability is nice and opens the door to a wider variety of enjoyment, but
I'll have to wrestle with these demons when the time comes.

I want to keep the price down around $400-$450 U.S., as much as I wouldn't mind a $1000+ rig. :-)

The other thing is, seeing as how there's bound to be lots of American's importing unblocked international/Canadian scanners, where is there a cheap/reputable place to order equipment in Canada?

Thanks a lot if you can help me on this.

: Actually, don't blame the FCC. The FCC was mandated by congessional
: legislation to develop and impose the cellular scanner restrictions
: that became effective last April.

: Just a point of reference to keep in mind.

Yes, but what if THEY REFUSED to develop and impose. I mean flat out
said NO. That is what they should have done. I mean so what if they
were to fire everyone at the FCC. The publicity alone would have
burned congress.

They -- like anyone else WITH A BRAIN (they obviously were lacking it)
could have refused. Point made.

(Supposedly the land of the free and the home of the brave, if it were
the home of the brave, the sissies in the FCC would have not accepted
the demands of congress. If it were the land of the free, congress
would never have suggested any such change!)

George Thurman (gst@gagme.wwa.com) wrote:

: Does anyone have the freq's for the Cellular Marine Band ??

: Does such a thing exist ???

: Please e-mail me if anyone can help.

: thanks !!

Better watch out, they might do some snipping at the 156 and 161 mhz segments next April if you start talking about this -- I mean heck, the idiots think they are private and readily give the credit card and phone calling cards over the marine "telephone" all the time!

Of course, since I only buy equipment from outside the U.S., such problems no longer affect me.

Currently, I am assessing my finances for this December to purchase (perhaps) the new AOR-8000 scanners.

Even though EDCO will have them in the U.S., mine will be better -- as it will be from the U.K or Canada. The one difference with mine is it won't have anything missing - ie BROKEN. It won't have been messed with by non-factory staff.

I urge people to tell EDCO -- IF they would like U.S. business, they had better start listening to their potential customers.

Either they supply instructions and a package of part(s) as a separate side item -- or we buy outside the U.S. Simple. Obviously I am referring to a certain portion of 800-900 mhz region.

The FCC seems satisfied with frequency lockout in the MPU. I heard the AOR8000 used modules in its construction.

Non-fully functional 4 or more channel scanners, boards, and parts do NOT require FCC approval and are NOT subject to these stupid laws.

Therefore, EDCO COULD and SHOULD (if they want MY business) package the board containing the lockout changes -- only in its international non-locked form, and SELL it as an accessory. Some smart scanner shops might go as far as to make a package deal of both -- the scanner and the upgrade kit (like the 8100 Uniden and its disks/code to enable cellular).

I think EVERYONE should call EDCO a couple of times a day and tell them they either provide the parts to change the scanner back to the FACTORY DESIGNATED SPECIFICATIONS or they had better file for

Bankruptcy -- because NON of us will be their customers.

I am sure you all get the picture by now. Someone is going to say "It is NOT EDCOs fault - they are only complying with the law to obtain FCC certification and sell the units in the U.S."

Well it -> IS <- EDCOs FAULT, if they fail to take the parts they change and bag them and sell them. Here is why:

The law does not cover kits, raw materials, components, and items which are not fully functional and complete. Selling the components they remove would BENEFIT THEM and US. We would readily get scanners in the US with more convenience. They would receive more sales.

It is NOT illegal to do this. So why the h*ll aren't they presently planning to do so? Where is the law that says they can not do this?

Since from the Factory, they come with cellular, and they remove it by something as simple as changing a component (adding/removing a component), WHY would the FCC approve such a unit next month? I mean it clearly violates the law as much as any other scanner from the past 3-5 years would have?

Where did the law state "as simple as adding or removing a jumper, resistor, or cutting a trace"? I think it said adding or removing a component. MPUs -ARE- COMPONENTS, right?

Now you see what I am getting at. It's about time someone took the government to court over the current line of scanners -- in that everyone of them (except the ICOMs where they removed the entire 800 mhz band) violates the rule of adding or removing a component, since that is the difference between international and domestic units.

Is there ANYTHING in the law dealing with preventing the dealers and manufacturers from selling the parts used in their overseas units -and- instructions to upgrade them to international capability?

Remember, kits and parts are EXEMPT from the law. Not addressed once.

6729. Obtaining Cell Scanners in US

Newsgroup: rec.radio.scanner
Date: 1994-07-23 12:45:58 UTC
From: steven@sgb.oau.org
Message-ID: <CtE8sp.F0z@sgb.oau.org>
Source record: 271437

I had an idea. Is it possible to purchase a "non-modifiable" scanner and send it to Canada or UK for brain transplant? Oh, oops, I meant service?

I was thinking, when sending an item to Canada or overseas for service or repair, there are no duties assessed. This means you could buy a unit here, send it there for a fix, and recieve it back with only the transportation charges out and back.

Also the return of the scanner could NOT be stopped -- because you would visit your local customs office and fill out a form which would remain with the unit (and a copy in your files) showing they examined the unit and that it was in your possession in the U.S. prior to its trip overseas.

Anyone in the UK/Canada thought of doing this yet?

One more thought on how to get around the idiots in D.C.

==========
DISNEYWORLD (Orlando, FL)
==========

Several weeks ago I posted a list of Walt Disney World
frequencies, and other associated frequencies in the Orlando
area. I've updated the list and added about 25 more. Authors and
contributors are for the most part unknown. I take no credit for
discovering them all, only for compiling and posting - enjoy!
Also, as posted previously, the people at Walt Disney World don't
take to visitors with scanners - be discrete!!

SUBJECT: Walt Disney World / Orlando Area Frequencies
WDW = Walt Disney World

118.450 Orlando Int'l Airport (Tower)

OK, for all of you guys that can't put your radio down when you go on vacation - The (un)official list of Walt Disney World Frequencies. (I'll give you a hint... I work at the Magic Kingdom, so this is about
as official as it gets.) All of these frequencies are confirmed; They were obtained from WDW Radio/Audio Central a:nd traffic has been heard on
each frequency.

Anything with a * indicates simplex and probably very low power. (The radios we use at 20,000 leagues are only 1 watt for operators and 4 watts for leads) If you don't hear anything, don't yell at me about

it,
you just aren't patient enough!

151.895 20,000 Leagues Under the Sea *
452.650 Cash Control (Wells Fargo Trucks) *
463.975 Custodial Base (EC and MK)
469.3375 E - Stops (Attractions) *
148.100 E-Stop Great Movie Ride *
462.550 Entertainment 1 (Characters)
461.300 Entertainment 2 (Parade Dispatch/Traffic)
464.9375 Entertainment 3 *
464.500 Entertainment 4 (Special)
453.825 Fire Channel 1 (Reedy Creek Fire Rescue)
463.750 Hailing (Disney - MGM Studios)
464.125 Hailing (EPCOT Center)
464.400 Hailing (Magic Kingdom)
154.47875 Light Barges (Electrical Water Pageant) *
462.675 Maintenance 1 (EPCOT Center)
464.625 Maintenance 2 (Magic Kingdom)
464.800 Maintenance 3 (Disney - MGM Studios)
462.650 Operations 1 (EPCOT Center)
462.575 Operations 2 (Monorails)
462.625 Operations 3 (Magic Kingdom)
461.600 Operations 5 (Disney - MGM Studios)
464.600 Operations Simplex *
157.740 Pagers (no input)
462.775 Pagers (no input)
462.850 Pagers (no input)
464.0625 People Finder *
468.8125 Point of Sale Systems *
462.475 Reedy Creek Energy Services
464.200 Resorts 1
461.700 S.T.E.P. (Fireworks)
151.655 Space Mountain/Riverboats/Studio Trams *
451.500 VUT
461.3375 Warehouses 1 *
461.9125 Warehouses 2 *

Also, Disney is steadily moving a lot of stuff to a 12 channel trunked system in the 800's. Currently, Security, Resorts, and Watercraft (plus some V.I.P's) use the system. I've seen the charts, and most of the traffic will move there within the next few years. Also, Disney should be setting up a 900's trunked system also. So, many of t non-theme park frequencies may be moving there. If you would like to know who to listen for on each channel, give me a note at:

I have both a discone antenna and a all-band antenna on my roof.
Both are from radio shack. The all-band antenna is a ground plane and
gives much much more gain than the discone. Plus it costs half the
price. Forget the discone just get the all-band.

Kanas has no particular laws regarding scanners.

In this town, the PD has always expressed appreciation when a citizen with
a scanner reports information about an item or event heard on a scanner.

Yes, it is the automatic repeater-ID. That is, the repeater (which extends
the range of the mobile radios) is broadcasting its callsign in Morse code.

> purchased, I'd be very grateful.

As far as I know, you don't need a kit to do that. At least, you don't need a special piece of hardware. All you need is a serial cable to connect the scanner to the computer, and the software. I've been coming across many ads in radio magazines for scanner control programs that have the PRO-2006 among the list of models that they support. There are also many shareware programs that do that. The serial, you can buy from any old computer supply store.

But, as I said, this is "as far as I know"... :)

Someone gave me something really interesting...it is a copy of a page
from a book of some kind. The page is hole punched on the left margin.
The page deals with JFK Int'l Airport. It shows a map of the airport with
details of terminals, de-icing sites, hangars, runways and taxiways (with ===== their
designations). It includes latitude/longitude,
various structures at the airport, cautionary notes and frequencies used
for various functions. While scanning you can follow the activity airport ===== while
looking at the layout.

The frequencies listed, and their designations, for JFK are :
JFK 115.9 - On Airport, ATIS Departure - 115.1 and 128.72, Kennedy clear-
ance (CPT) - 135.05, Ground - 121.9, Tower - 119.1, New York Departure -
135.9, International Arrival Term. Ramp control - 130.77, Gen. Aviation ===== Term. -
12.95, VOT - 115.1.

I'd like to get similar pages for other airports in the area (LaGuardia,
Newark, Republic and Islip/MacArthur). Any ideas where to get them ?

In article <774971744.AA00448@pfzrfsg.com>, sysop@pfzrfsg.com (System Supervisor) writes:

The following is a section of Indiana Criminal Law and Procedure that pertains to scanners:

35-44-3-12 Unlawful use of a police radio; exemptions; "portable police radio" defined
Sec.12. (a) A person who knowingly or intentionally possesses a portable police radio commits unlawful use of a police radio, a Class B misdemeanor.
(b) This section does not apply to:
(1) a governmental entity;
(2) a regularly employed law enforcement officer;
(3) a common carrier of persons for hire whose vehicles are used in emergency service;
(4) a public service or utility company whose vehicles are used in emergency service;
(5) a person who has written permission from the chief executive officer of a law enforcement agency to possess a portable police radio;
(6) a person who holds an amateur radio license issued by the Federal Communications Commission;
(7) a person who uses a portable police radio only in his dwelling or place of business;
(8) a person:
(A) who is regularly engaged in news gathering activities;
(B) who is employed by a newspaper qualified to receive legal advertisements under IC 5-3-1, a wire service, or a licensed commercial or public radio or television station; and
(C) whose name is furnished by his employer to the chief executive officer of a law enforcement agency in the county in which the employer's principal office is located; or
(9) a person engaged in the business of manufacturing or selling portable police radios.
(c) "Portable police radio" means a radio receiving set that is capable of receiving signals transmitted on frequencies assigned by the Federal Communications commission for police emergency purposes and that:
(1) can be installed, maintained, or operated in a vehicle; or
(2) can be operated while it is being carried by an individual.

This term does not include a radio designed for use only in a dwelling. As added by Acts 1977, P.L.342, SEC.1.

SNIP.....

Important thing there is not very much radio chatter doing an airshow routine. "Snowbirds...Smoke now!

so don't expect to hear too much. At most airshows the Snowbirds run the lead comands over the PA with the music..

Unless it's something specifically produced for JFK, it sounds like you might have a page from the US Terminal Procedures manual. I've got an old one for Florida that shows information similar to what you've described. You can get these guides from local flying clubs (I got mine at a small regional airport). They are published by NOAA and the Dept. of Commerce and usually cover a state or two in the same region.

Again, I'm not sure that's exactly what you have, but the Terminal manual contains the same information.

I already have police and fire frequencies for the SF Bay Area, San Mateo and the central peninsula to be more exact. However i would like some frequencies for local cable,phone,gas,electric,etc.....stuff that can't be found as easily through books like Police Call (which i have and strongly reccomend).
+
Also, is there a FAQ for this group lying around somewhere? And is there a new freq directory accesible via telnet (like the one which used to be at tcomeng.com?)

All help appreciated.

6747. Radio Shack Frequency Counter Info

Newsgroup: rec.radio.scanner
Date: 1994-07-24 03:02:50 UTC
From: mat@netcom.com
Message-ID: <matCtFCGr.2Mp@netcom.com>
Source record: 271449

I own the Radio Shack Frequency Counter and it works fine
for scanner enthusiasts and it is only 99$. Features are lacking on it. My
only complaint is that there is no hold button. It is hard
to remember the freq. it counted before it disappears. The
only features that it has is you can select the gate time
fast or slow the faster it drops a decimal example....
870.3451 on slow gate or 870.345 on fast gate. It should
not mater if you are using it as a scanner tool. You can
also select the input type 50 ohm or Hi-Z. Hi-Z is used
for hooking it to the output of an oscilloscope. I have
had great fun with my counter. Especially when you are
driving and you see some one on there cell phone. You pull
up next to them and turn on the frequency counter. You
wait for it to register the cell frequency and then punch
it in to the scanner it is laughs. It works great for
finding those unknown frequencys. People do find it quit
strange that you are following them with this strange
device. I will include the Frequency Counters
Specifications they are as follows...........

LCD RF
Frequency Counter Cat. No.22-305

Gate Time .... 64 ms (Fast); 640 ms (Slow)
Display .... 8-Digit LCD
Display Update Rate .... 128 Ms (Fast)
1.28 S (Slow)
Display Resolution .... 1 kHz (Fast)
100 Hz (Slow)
Accuracy (when AC powered):
1 ppm +/- 1 Least Significant Digit
Operating Temperature:
+ 64 F (18 C)/+95 F (+35 C)
Power Requirements:
4 x AA Alkaline Batteries
4 x AA NiCad Batteries
or any 9 VDC Power Adapter - Center

INPUT CHARACTERISTICS
Range ....1 MHz to 1.3 Ghz
Sensitivity .... 150 mV min. 1 MHz to 1.3 Ghz
see table 1
Dynamic Range .... 10 mV to 1 V rms
Coupling .... AC
Input Impedance .... 50 Ohm or Hi-Z

Absolute Maximum Input Level ..... 1.4 V p-p
(You Might damage the counter
if you exceed this level.)

TIMEBASE

Frequency ..... 4 MHz
Initial Accuracy ..... 1 ppm

Typical Input Sensitivity (50 Ohm Mode)

Frequency (MHz) Sensitivity (mV)

>The page deals with JFK Int'l Airport. It shows a map of the airport with
>details of terminals, de-icing sites, hangars, runways and taxiways (with ===== their designations). It includes latitude/longitude,
>various structures at the airport, cautionary notes and frequencies used

You have the airport diagram page out of a pilot's appoach plate book,
most likely published by Jeppesen or the Federal Government. Anyone
can buy the government book at a local pilot/aviation supply shop. The
Jeppesen books, which many pilots prefer, are just becoming available
in stores, having been available before only by subscription.

Probably the cheapest source of the data you wish is the Airport
Facilities DIrectory, or one of the myriad other published flight
guides.

Or you could make friends with an instrument rated pilot who might
give you old copies because each book is only good for 56 days.
(I'd send you what you want except I only get California charts.)

Cheers,

John Hall

> > key errors that can identify the list of freqs as a duplicate of the
> > copyrighted source.

This is not true for three reasons. First, facts cannot be copyrighted. It seems rather obvious that the contents of something like Police Call is just factual information. Second, most of these listings are take from federal government sources, which cannot be copyrighted. Finally, a relatively recent Supreme Court case, Feist v. Rural Telephone Company, set a rather strong precedent for this kind of copyright, basically tossing out the idea that "sweat of the brow" is a defense for copyright. In other words, it doesn't matter how hard you work at compiling something, if there isn't creative content, it's not copyrightable.

I got a bunch of questions about the thing. Please don't flame
me for reasking something which might seem obvious, its unneccessary.

When is it due out (or is it already out)?
Are there any reviews of it?
Is it computer controllable?
What is the status of cellular on it? Can it be modified by
replacement of a ROM/PROM/EPROM/EEPROM chip. Are
foreign models available without cellular restrictions? etc...

Thanks.

Dan

6757. RS-2036 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-07-24 11:41:20 UTC
From: plymale@mousetrap.es.vt.edu
Message-ID: <30tk10$5h@solaris.cc.vt.edu>
Source record: 271463

One of the local Radio Shacks just received a new scanner,
model RS-2036. A look at the manual showed interesting
features such as auto store capability of active frequencies
during a range search. Anyone know if this model offers
triple-conversion, or other desirable features?

The RS-2036 appears similar to the Bearcat 890XLT scanner.

Thanks,
Bill

6758. Aux Speeker for BC200XLT

Newsgroup: rec.radio.scanner
Date: 1994-07-24 13:02:30 UTC
From: JPINTO@VNET.IBM.COM
Message-ID: <19940724.090230.367@VNET.IBM.COM>
Source record: 271333

I have a Bearcat BC200XLT and would like to find out if anyone knows if an aux amplified portable speeker exists that will work with a handheld unit. I find the audio of the 200 to low when driving in a car or have it hanging on a belt clip under several layers of winter clothing. I tried an un-amplified remote lapel speeker from radio shack but found that I needed to crank the volumn near full to power the speeker. There is alwas the ear plug but I don't care for that option. Any advise would be appreciated. Thank you in advance.

Sorry about the first post. It is my first. I am interested in starting a discussion on handheld scanners. As I am new to scanners I have been reading this newsgroup to learn as much as I can. I would like to pose a few questions.

1. I have heard of a few models of scanners. Pro43, BC-200, BC-2500xlt, and Icom R-1 are a few that maybee all the newbee's to scanning would like to here about. Also, any not mentioned could be game. The Idea is to here from people that know about these radio's and have opinions as to why x is better than y and so on.

2. What is the reason scanners that get 200mhz-406mhz cost $100+ more than scanners without those frequencies. Is it worth it?

3. Where is the best places to get a decent price on scanners.

If this is an overdone thread then please send me info by E-Mail. Although I think there are many people that might like to read about this in news. Thanks for your time

Is anyone familiar with (or know where to
find out) the frequencies used
by the sorts of wireless microphone, monitor,
and guitar equipment used by amateur and professional
musicians? How are frequencies allocated to
touring acts? Are these "itinerant"? Or
does the short range make them exceptional?
Also, does the high end stuff use encrypted or
digital encoding that would make it more difficult
to hear?

Please email or post if you think your
reply is of general interest.

Thanks much,
TJP

6762. Discone antenna

You will like the Diamond or similar model from Grove if you like to
listen below 50MHz. Similarly if you don't care a lot for below
50MHz you can get by with the RS Discone. I boought the RS, put it
together, tried it, took it apart and then returned it for a refund.
There was considerable time wasted. I have owned my Diamond
since late 1987 with no regrets.

: Andy

It -may- be true it's discontinued. But since we are speaking of
The Grove Garbage [Can], I'd suggest getting a second opinion from
a reputable dealer. Grove's reputation is one of "if it will help
us sell more, we're behind it 100%" - and they are known to stretch
the truth to encourage panic buying -- See any of their catalogs (of
the past few months for proof of that).

: : although no newly manufactured scanner may be capable of, or may be
: : easily modified to receive cellular transmissions, it IS still legal to
: : sell kits that will modify a scanner to these abilities. I also
: : understand that it is legal to sell a cellular capable scanner in kit
: : form that a consumer can put together themselves. Am I correct in my
: : understanding of these items? If so, where are these products? Why
: : haven't the scanner makers jumped on this oppertunity? Any & all comments
: : on this would be welcome.

: No. You should be able to purchase repair parts, to repair a scanner that
: already receives the cellular frequencies.

: However, modification kits are now illegal - as are frequency converters.
^^^^^^^^^^^^^^^^^ ^^^^^^^^^^

<<< WARNING -- ENGAGING TURBO FLAME MODE >>> <<< FULL POWER >>>

WRONG Bill! Kit's are NOT illegal under any present law. Since a
kit is not a complete product it does NOT require FCC approval, and it is
not considered an imported or manufactured product. Admittedly, the person
who builds such a device could be thought of as a manufacturer, but the point
stands that a KIT, ie parts, board, box, plans, IS NOT ILLEGAL.

If it were, you would of course point out the section of documentation
to support that claim (waiting to see documentation references).

Modification kits are also NOT illegal -- the law states that scanners
which can be readily modified are. But, the parts to restore them to the
original INTERNATIONAL factory standards (which the U.S. government thought
to try and make a U.S. Standard instead, meaning NON-CONTINUOUS) ARE NOT
ILLEGAL to purchase or install.

I'd really like to see someone put in the time -- come out with the
kits and make a mint -- as they could thank the U.S. Government for the
new business. As far as I can see, with the PRO-43, all it would need is
for the digital/logic board to be swapped. That board (in its international
version) is something I plan to find out the cost of. I mean the entire
board (that has the processor, diodes, etc). It is all digital, therefore,
no tuning is needed after the swap. Get the picture? This could be the
easiest modification so far, you order in the board, move D3 to D4, open up

the Pro-43, extract the broken US-censored board, replace with board from the Tandy-UK market, re-assemble. Done. That is one angle I am pursuing.

Now, I left that above to illustrate the points. The board is NOT FCC approved, but that board is NOT a scanner of 4 or more channels, nor is it a manufactured product. It is a board, with parts. It does not function on its own. The limitations of duties is to the value of the BOARD. NO LAW AGAINST IT. If there is, PLEASE CITE YOUR REFERENCES.

Thanks.

: Both are covered by the ECPA.
^^^^^^^^^^^^^^^^^^^

WRONG AGAIN! The ECPA does not state you can not convert receivers to receiving cellular, it deals with how you use the device, not what the device is capable of doing. While the ECPA says its against the law to LISTEN *unless* you are looking for a source of interference, it does not prevent you from possessing equipment capable of doing so, OR re-selling such equipment to others.

: I don't know if scanner kits have to be type accepted, or not. If they do,
^^^^^^^^^^^^
KITS CAN NOT BE FCC TYPE ACCEPTED. This is due to the style of case must be taken into account. Since these normally allow for an OPTIONAL case kit to make it look professional, they do not include the case to avoid any chance of needing FCC approval. Since without the case, the FCC could not approve it.

KITS are a bag of parts. Plans. Box. These are basic raw materials. You may build it as described, or you may have bought the box and parts for something else which just happened to have what you needed. NO FCC approval needed or obtainable. Not a manufactured product.

: then you will not be able to legally buy one that can easily be modified to
: receive cellular transmissions.

<<< REDUCING FLAME MODE TO 50% POWER >>>

You need to brush up on the law a little. Hopefully the comments above will set you in the right direction. You are off course enough degrees to miss the runway right now. If you have legal references, please cite them in a follow-up. Thanks.

<<< FLAME MODE OFF >>>

6767. My Uniden Bearcat BC140 scanner failed, get just a buzz now

Newsgroup: rec.radio.scanner
Date: 1994-07-24 21:42:12 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCtGsAD.J4A@netcom.com>
Source record: 271468
Cross-posted to: rec.radio.scanner,sci.electronics.repair

My old scanner, a Bearcat BC140 10 channel scanner, has a failure. I just get a buzz, and no led display. Figured the power adaptor went bad, and used a regulated power supply around 12 volts, still no good. Well, I get a "1" on the led display, but no scan, keys dead, somethimes a bit of crackle from the speaker. Squelch and volume don't do anything.

Anyone have this or similar problem, and found what defective part did it?

Scanner worked fine a few days before.

I got myself a PRO 2006 some months ago, so I'm not "deaf". But this old one had its uses, and if it's a standard problem that my failure is, I'd like to fix it. Or else it goes into the junk box.

6768. Emebassy frequencies,Washington DC

Newsgroup: rec.radio.scanner

Anyone out there got a collection of frequencies used by foreign
embassies in the nations capital,Washington,DC?
I'l take anything,like RTTY and other digi modes,even VHF-UHF if available.
Many thanks in advance de Paulo,N3MGA

What I do is simply wear the critter on my belt through the airport (leave it squawking on police freqs, etc if you want), then when I go through the metal detector, just pull the unit from the leather belt case and hand it to them. I might suggest that you unsquelch it fully to blare static when you hand it to the detector attendants, so that they can tell it's a real radio and not just an empty C-4 packed case. Only offer explanations if they ask about it.

Sherrod

>At one point, I
>could hear both sides of conversation where one end was a sheriff
>deputy in the field, and the other end was, I believe, CHP dispatch.

This may true elsewhere in the state as well, but in San Mateo county, I often hear the county sherrif communicating directly with CHP mobiles (91-xx units) on county frequencies. In other words, the CHP units have county-capable radios with them. It's possible that the CHP mobile didn't have good enough comms with CHP dispatch in that particular location, so used county radio for assistance.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or | publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't

make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more.

If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a restocking fee for returned merchandise. Telephone (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner

modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even

the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to | use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA
General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly
publication, The American Scannergram, is about 60 pages
long. Although concentrating on Ohio, there is frequency
information from other states, and plenty of good product
reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo,
AOSCNet, distributed via FTN on 6 BBS systems, and via
Internet Mailing list. Rick Christian advises these strict
rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions
on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA
'84, TDDRA '93, (18 USCA 2510 et seq.) or
Communications Act 1934 & 1984 as amended (47 USCA
705), i.e., decoding/reception of paging, cellular,
encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material
(except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via
Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

August 13
October 15
December 10

Bring a notebook and your appetite.

I have a spool of RG-39/U, 73 ohm cable with no insulation. Is this stuff ok
to use for a remote antenna ?

I have a TV antenna in my atic that's not being used, would a run
of the above cable to the TV antenna improve reception?

thanx
paul

6774. How to Find Scanner Frequencies

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners. |

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me. |

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13. |

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing |

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of

listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can * obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape |
labels embossed with frequencies or call letters glued to
the front of base stations.

You can make your own opportunities for eyeing the
equipment or take advantage of "open house" events. If
information is displayed publicly, then a reasonable person
could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I
examined a military manpack radio being used by
dispensary paramedics. The radio's tuning dial was
set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored
personnel carriers at the local county fair, each
equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM
radio had a set of channel select pushbuttons, much
like those in a car radio. I asked a guardsman a few
questions about the radio, and he demonstrated the
channel preset feature. A panel above the channel
pushbuttons was labeled with the frequencies: 32.055,
34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at
the Marseilles armory "open house". The public was
permitted to climb aboard, and observe the
instrumentation and radio gear. A channel plate on
the instrument cluster listed over a dozen
frequencies.

Hobbyists are urged to exercise a modicum of restraint and
good judgement. In New Jersey, a radio technician/hobbyist
called to service a transmitter in a county building,
noticed a new unattended repeater installation in the same
room. Being curious about what frequency this repeater was
on, he opened the access door to copy the frequencies from
the radio's crystals. It turns out that this radio
belonged to the US Secret Service, and opening the access
door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's
permission to tamper with that equipment. |

Another source of frequency information is as close as your |
nearest Radio Shack store. Some Radio Shack stores make a |
local frequency list available to assist their scanner |
customers. Be sure to ask. Stores located in shopping |
malls almost always know the mall security frequencies. I |
often check the frequencies programmed into the floor model |
scanners, too. |

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the first Bearcat models, did not provide individual channel lockout capability. Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor

performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

More Modern Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT. |

Obtaining Crystals |

If you do purchase a crystal controlled scanner or monitor | receiver, you will probably want to buy more crystals to | cover local frequencies. |

Scanner crystals may be ordered from your local Radio Shack | store or from one of the companies below. Be sure to | specify the operating frequency you want and the brand and | model of scanner. |

Some companies may ask you to send a schematic of the | scanner or require more detailed information, like series | or parallel resonance, load capacitance, etc. |

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator

radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding

components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast.

Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of

direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow

control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different than the common series resonant crystals used in Regency and Radio Shack scanners. Sometimes, Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the

rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Here's a sad story I'd like to share...I was modifying my PRO-34 (the old Pro-43), and in order to get after D11 (or whatever), you had to take out the top board and a metal shield plate. To do that, you had to desolder the BNC connector and the power on/off switch from the board. I did that, and got the diode out. Then I replaced the plate and the upper board, and soldered the BNC connector back on. Then, when I went to solder the power switch back, I accidently created a "jumped" connection between the negative and positive leads from the knob.

In another words, I have 'On' and 'On with volume'. Boy I wish I had a solder sucker-upper.

If you need UHF Air and 800Mhz coverage adding 2 extra elements cut to each frequency range was REAL easy. Now I've got an all band optimized for all my scanner bands.

The discone is still not bad if all you want is 'general' coverage and gain is not an issue.

The price is definitely worth it. Extra filtering to reduce out-of-band
signals. Plus lots of interesting listening up there.

The 2500 has continuous coverage and some dealers still have stock that can be modified to receive the cellular frequencies. If you're interested I'll pass on the dealer I know of...

Hi...
I'm in the market for a handheld scanner immediately. The specs I'd like:

*cop/emergency freq range
*private ranges
*cordless range
*call range (but only a wish...this isn't necessary).

Anyway, I want to make the purchase by the end of the month (in 1 week),
and if you have a used handheld for sale, $100 or less, are willing to
guarantee functionality, features, and freqs, and are willing to ship
C.O.D., please email me immediately.

Thanks,
Mark

6786. Cells on portable TV?!?

Newsgroup: rec.radio.scanner
Date: 1994-07-25 03:50:47 UTC
From: umlangston@cc.memphis.edu
Message-ID: <1994Jul24.225047.21783@msuvx2.memphis.edu>
Source record: 271342

Just a tidbit for the curious (and, aren't we all?)

I got bored the other day, and started twiddling the tuner on my Dad's Goldbeam 5" B&W portable TV (the cheap kind, with analogue TV tuning and seperate AM/FM tuner).

Anyway, I was fooling around, mucking about UHF channel ranges 80-83, and I started getting cell phones. Never complete calls, but instead segments. The tuning was quite rough, and one strong signal would seem to carry several weaker ones. I figured they were cell because a) if I remember my physics, that's about the right freq range, b) people would say they were at a certain street when someone asked "where are you?", and c) (most telling) I could catch the very brief data packet bursts at the beginning or, more frequently, at the termination of calls.

Has anyone else experienced this, have an explanation or correction, or just care to comment? I was surprised.

Thanks,
Mark

Repeaters, which are used to extend the range of hand-held
radios, or mobile radios.

They're *not* amatuer repeaters. The range for the 70cm amatuer
band is 430MHz-450MHz. What you're hearing might be police,
ambulatory/rescue, or, even more likely, business radios and
security repeaters.

If you give me some specific freqs, I might be able to weed out
what they are.

>
First of all, what is a "speeker"?
As far as the low audio when using an external SPEAKER, there is a mod you
can do to get vastly more audio out of the earphone jack. I never used
it much for headphones anyway but if YOU do, be carefull. You may wind
up needing a hearing aid for which you won't have to worry about the scanner
audio anymore. Consult FTP hamster.business.uwo.ca in /pub/mods.

Jeepers, creepers, where'd you get those speekers? [sorry, I had to :)]

6792. QT service code and Mobilevision??

Newsgroup: rec.radio.scanner
Date: 1994-07-25 09:24:00 UTC
From: barkman@zeta.is.tcu.edu
Message-ID: <1994Jul25.043443.262@news.tcu.edu>
Source record: 271347

How exactly does the 220-222 band QT television ordering thing work?
I see it licensed in my area as 4 kHz wide SSB signals for use within a
50 mile radius using either 50W or 50mW and 10W or 10mW. It looks like
it is going on a 500' tower.

And what is this Mobilevision that is licensed on channels between
904.375 and 904.600 MHz for 50,000 pagers at 25kHz bandwidth?
It also has a single 8MHz-wide 922.000 MHz repeater. The service code shows
it to be radiolocation and the class (LR) also verifies that. This also
has a 50 mile radius of operation and is going up on two towers around town.
I believe the emission type has this as multi-mode with video and data.

Any info on this would be appreciated.

FYI, the main purpose of BINARY and ASCII modes in FTP process is that there are many routers that are only 7 bit and can not handle the 8 bit characters of encoded or .exe type files. Selecting BINARY will allow ALL files to be transfered successfully. If you know the file is only 7 bit ASCII text, you can use ASCII mode, but why take the chance? If you always select BINARY mode, you will never have to worry about what is in the file.

An ear syringe, the little bulb device used to squirt warm water into the ear, works well as a solder sucker. Just don't use it on your ear anymore. Then fit the syringe with a little metal sleeve such as you'd get off a mechanical pencil into the syringe so that you're not going to melt the syringe itself with the hot solder. I made one of these before solder suckers became famous. Hmmm...shoulda gotten a patent.

If you examine the feedback path, as the original poster described, the path is from the car stereo to the headset mic. The headset earphone is really just monitoring the path. So if anyone gets hearing damage it will be the guys in the car!! (not to mention possibly blowing the car speakers).

Not the best thought out prank.

>But this doesn't mean a lower priority radio will get bumped off the repeater
>if a police or fire radio keys up, does it? I have never heard this happen.

As I recall, the "priority" means that they are first in the queue of
radios waiting for an open channel. This would only happen if there were
more than one radio in the queueue - the PD would get an open channel
before the sanitation department even if the PD got into the queueueue
after the sanitation dept.

I don't *think* you would get "bumped" ...

>priority feature from the radio? I seem to remember a Moto trunk system that

My understanding is that VHF radio signals are vertically polarized, while TV signals are horizontally polarized. Therefore, TV antennas will not do much for reception...

There are a number of relatively inexpensive scanner antennas that will do a good job. I've personally been happy dealing with Grove and Hamtronics, but all disclaimers apply.

Source record: 271358

(Just a few comments from an actual user of the thing!)

The Optoelectronics DC440 is highly recommended by yours truly.
Picked it up a week or so ago and added it to my R-7000. Works nicely,
the '440 docs gave enough info to enable me to modify the R-7000 to
work with it and it's generally a useful little device.

It shows you DCS, DTMF and CTCSS codes/tones on whatever you're listening
to.

One nice little touch is that it can respond to the squelch line of you'r
(whoops, your) receiver - thereby knowing when to clear display and start
looking for new data again.

All in all, well worth the money and (for the scanner purists's money)
probably a neater dovetail into scanning receivers than the Universal
M-400 provides (just my own opinion!).

The Mobilevision is an automatic vehicle location/location & monitoring system. These have been authorized since the 70s but the field is only heating up now. Look for these to be all over the country as the FCC wraps up the contentious rule rewrite, within a few months if not very soon.

The other thing is a mobile radio service and not the television ordering service, which is just below the band you cited. The 220-222 band is a narrowband land mobile band.

UHF TV channels 70-83 were re-allocated to other services years ago.
Older TVs with the higher channels can tune to cellular frequencies.
Channels 73-77 and 80-83 are where to look. The problem is TV broadcast
audio is wideband (50 KHz) and cellular phone is narrowband (in the 5-10
KHz range-I don't know exactly), so you will have problems with multiple
phone channels interfering with each other.

Your understanding of the polarization of transmitted signals is
correct, however:

- reflected signals and edge refraction can change the polarization
of such a signal prior to it reaching the receiving antenna.

- Simply rotating the TV antenna will change the polarization of
the antenna.

6815. ICOM R1 INTERMOD PROBLEM

Newsgroup: rec.radio.scanner
Date: 1994-07-25 18:31:16 UTC
From: jim@ttech.com
Message-ID: <jim-250794103116@jimsmac.ttech.com>
Source record: 271362

I recently purchased a new ICOM R1 (with cellular) and am having EXTREME intermod problems in the 460 mhz range. Specifically, when tuned to 460.100 mhz,
a signal on 460.050 mhz completely wipes out the signal of 460.100 mhz. The signal on 460.100 mhz is completely unreadable. I have noticed other intermod problems with the R1 and contacted Icom technical support this morning. Icom technical support stated that this type of intermod is typical for a wide band receiver such as the R1, and suggested antenna attenuation (an aftermarket item). Is anyone else out there experiencing this problem? Are there other scanners (Trident, AOR) that provide the wide band coverage of the R1 without the extreme intermod? If so, what are the advantages/disadvantages of these units? Please reply soon, as I only have a week to return the R1.

-Jim

Steve,

So lets say I develop a processor 'add-on' board to work with specific
receivers that 'force' the scanner to cover whatever frequency range I
want and market it, it's legal. Especially if it's not even an RF device.
Any other comm's engineers that want to discuss the possibilities of this
w/me? Time to break out our scanner service manuals...\

Older TV's that could receive up to UHF channel 83 could receive cell-calls.
The tuning is tight but w/perservence and a preamp you could 'tune' across
the cell bands. I have a Motorola RGB color monitor TV tuner adapter that
I played with for a while. I added a preamp and programmed in the busy
channels in the area and it worked quite well.

This may be a stupid question, but that's what we're all here
for anyhow.....

I was considering an all band antenna to put in my attic. Problem
is that I really have no way to "ground" it. The question is, do
I really NEED a good grounding connection or what? Any help
would be appreciated.

This sounds more like a selectivity problem than intermod. I would try a
weaker antenna that will still receive 460.1 but makes 460.05 much less
powerful. There isn't much else you can do, especially if you're real
close to the 460.05 signal and far away from the 460.1 signal.

Cross-posted to: rec.radio.shortwave,rec.radio.scanner

I have two NRD535D Deluxe HF receivers for sale. The 535D has the best computer interface of the high end tabletop receivers that I have used. One of the two has the High stability oscillator and the narrow C W filter too, while the other does not have these options.

the one with the high stability oscillator and cw filter is $1200 and the stock one is $1100. The stock one has a minor dent on the top cover from sitting at the bottom of a stack of receivers.

The nrd525 for sale includes the narrow CW filter and the computer interface with cable.

Each of the three NRDs will be provided with a copy of the computer control program, NRD, written by Tom Whiteside. It is a great program and I will include lots of frequency logs to go with it. The program runs on PC compatibles

call or email inquiries, buyer pays shipping. I am the original owner of one of the 535Ds and the 525 btw.

steven@sgb.oau.org (Steven Bradley) wrote:

> Kit's are NOT illegal under any present law.
Hmmm ... 47 CFR 15.3(p), Definitions - Kit; 15.23, Home-built Devices; and 15.25, Kits would seem to address this. Admittedly, they're more concerned with TV interface devices, but a blanket statement that there is no law is misleading (it's a regulation, not a law).

> ... with the PRO-43 ... you order in the board, move D3 to D4, ...
Moving D3 to D4 would lock out the cellular freqs. Kinda defeats the whole purpose of getting a non-US board.

> While the ECPA says ...
Again misleading, since the law affecting modifiable scanners was TDDRA, which caused the FCC to add 47 CFR 15.121 (ref. 58 FR 25575, 27 Apr 93; 58 FR 29454, 20 May 93).

> KITS CAN NOT BE FCC TYPE ACCEPTED.
Type Acceptance applies to station transmitters; the procedure for scanners is Certification. Note that the kits specified in 47 CFR 15.25 are still subject to Certification or Notification, as appropriate. Note also that a replacement CPU board would be a subassembly, not a kit.

> ENGAGING TURBO FLAME MODE
Maybe a little less heat and more light might be appropriate.

> You need to brush up on the law a little.
I must have bought the wrong modem. It appears that a lot of other people got a law degree packed in with their's <g>.

$//Scanning receivers, ET Docket No. 93-1, FCC 94-183//$

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

In the Matter of
)
Amendment of Parts 2 and 15 to)
Prohibit Marketing of Radio Scanners) ET Docket No. 93-1
Capable of Intercepting Cellular)
Telephone Conversations)

MEMORANDUM OPINION AND ORDER

Adopted: July 8, 1994 ; Released:

By the Commission:

INTRODUCTION

1. By this action, the Commission denies a request by Kenwood Communications Corporation (Kenwood) for reconsideration of portions of the rules adopted in the Report and Order in this proceeding. Those rules, which were adopted in response to the recently enacted Telephone Disclosure and Dispute Resolution Act (TDDRA), Pub. L. 102-556, generally prohibit the manufacture and importation of radio scanners capable of receiving cellular telephone communications. Kenwood seeks changes in the implementation dates for the rules, an exemption for scanners intended for use by certain parties and a relaxation of the definition of equipment that can be readily altered by the user. We find the rule changes requested by Kenwood to be inconsistent with either the intent or the specific provisions of the TDDRA.

BACKGROUND

2. As defined in Part 15 of our rules, scanning receivers, or "scanners," are radio receivers that can automatically switch between four or more frequencies within the 30-960 MHz band. Historically, the Commission has regulated scanners only with respect to the radio noise that they inherently generate. As a result, many, but not all, currently-available models of scanners are able to receive communications in the Domestic Public Cellular Radio Telecommunications Service, i.e., the cellular service, which uses frequencies in the 824-849 MHz and 869-894 MHz bands. In addition, several publications have described relatively simple modifications that users can make to enable other models of scanners to receive the cellular

frequencies.

3. Section 403 of the TDDRA requires that the Commission adopt rules to prohibit the manufacture or importation of scanning equipment that can be used to intercept cellular telephone communications. This section requires the Commission to amend its Part 15 regulations to deny equipment authorization to scanners capable of:

- receiving transmissions in the frequencies allocated to the Domestic Public Cellular Radio Telecommunications Service;

- readily being altered by the user to receive transmissions in such frequencies; or,

- being equipped with decoders that convert digital cellular transmissions to analogue voice audio.

Section 403(a) of the TDDRA also requires that the Commission prohibit the manufacture and importation of scanners that do not meet the new requirements beginning one year after the effective date of the amended rules.

4. On April 19, 1993, the Commission adopted the Report and Order in this proceeding, implementing the requirements of the TDDRA. The rules became effective on April 26, 1993, and the manufacture and importation of scanning receivers that do not comply with the new rules will be prohibited as of April 26, 1994. The rules define scanners that can be readily altered by the user as:

... those for which the ability to receive transmissions in the cellular telephone bands can be added by clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer.

DISCUSSION

5. In its Petition for Reconsideration, Kenwood raises three issues. First, it argues that the deadlines for complying with the rules adopted in this proceeding should be extended because its product development cycle can often take several years. Second, it requests that scanners sold to Military Affiliate Radio Service (MARS) and Civil Air Patrol (CAP) licensees be exempt from the regulations adopted in this proceeding because MARS and CAP licensees, by virtue of their licenses, are already directly subject to Commission jurisdiction in the event that they illegally monitor cellular communications. Finally, it argues that the definition of "readily altered by the user" that was adopted in this proceeding should include only scanners that can be modified "quickly" by "non-technical" consumers. There were no comments filed in response to the Kenwood petition. These issues, along with our findings and conclusions, are discussed below.

6. Implementation dates. Kenwood contends that the April 26, 1993, cutoff date for equipment authorization and the April 26, 1994, cutoff date

for manufacture and importation of scanners that do not comply with the new rules do not provide sufficient time to design and build new products to replace those being prohibited. We recognize that the cutoff dates provide only a limited amount of time for transition of products to the new rules. This short period of time is, however, mandated by the TDDRA and reflects the position of Congress that reception of cellular communications by means of scanning receivers is a serious problem that must be resolved expeditiously. Accordingly, we are denying Kenwood's request for an extension of the cutoff dates for importation and manufacture of scanners that do not comply with the new rules.

7. Exemption for equipment sold to MARS and CAP licensees. Consistent with Section 403(c) of the TDDRA, the new rules exempt only scanners sold to cellular telephone service providers and federal, state and local governments from the cellular scanner prohibition. Kenwood requests that we also exempt scanners modified at its factory for use by MARS and CAP licensees.

8. Kenwood states that it manufactures two-way transceivers for licensees in various radio services, including land mobile, marine, and amateur users. Some of these transceivers contain scanning capability and, as such, are subject to the rules adopted in this proceeding. While the transceivers are generally set up to operate only on frequencies available within a particular radio service, Kenwood indicates that some of its transceivers are routinely modified at its factory to operate on additional frequencies, such as those used by MARS and CAP licensees, in order to accommodate the needs of its customers. Kenwood states that these factory modifications can result, incidentally, in the ability to scan cellular telephone frequencies. Kenwood argues that MARS and CAP licensees, by virtue of their license, are already directly subject to Commission jurisdiction in the event that they illegally monitor cellular communications, and that therefore there is no need to restrict its factory modifications.

9. We see no reason why it is not possible to manufacture equipment to operate on MARS and CAP frequencies without resulting in that equipment also having the capability to receive the cellular frequencies. MARS and CAP frequencies are far removed from the cellular frequencies. Consequently, we find that there is no technical justification for exempting scanning equipment from the rules adopted in this proceeding based on its intended use by MARS or CAP licensees. Furthermore, although the TDDRA did exempt certain scanners from its requirements, as discussed above, it did not provide for exemptions such as that requested by Kenwood. We recognize that some manufacturers of existing equipment may find it difficult to block out cellular frequencies. However, while the restrictions we have adopted may make it somewhat more difficult and expensive to manufacture certain MARS and CAP equipment, we do not believe that the costs associated with complying with the TDDRA are so great as to justify creating an exemption for MARS and CAP equipment. Moreover, Kenwood's argument that we can take action against any Commission-issued license if the licensee is found to have violated federal law ignores the intent and specific provisions of Section 403 of the TDDRA. Accordingly, we are denying Kenwood's request to exempt equipment sold to MARS and CAP licensees from the rules adopted in this proceeding.

10. The definition of "readily altered by the user." Section 403(a) of the TDDRA requires that the Commission deny equipment authorization to scanners capable of being "readily altered by the user." It does not, however, specify the characteristics of a scanner design that is "readily alterable." The only indication of the definition Congress intended for "readily alterable" is found in the legislative history of the TDDRA, where Congress expressed concern about scanners that can be modified by "cutting a single wire" or following the instructions in a "how-to" manual. Based on this information, we proposed, and ultimately adopted, a definition of "readily altered by the user" that describes scanner designs like those found in "how-to" manuals currently on the market. Our definition of scanners that can be "readily altered by the user" reads as follows:

Receivers capable of "readily being altered by the user" include, but are not limited to, those for which the ability to receive transmissions in the cellular telephone bands can be added by clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer.

11. Kenwood requests that we modify the definition of "readily altered by the user" to include only devices that can be quickly modified by "non-technical consumers." It argues that our description of readily alterable devices does not provide adequate guidance to manufacturers because it only provides a few anecdotal examples, leaving the manufacturer to guess whether or not other designs would be considered "readily alterable."

12. We believe that Kenwood's proposed definition would make it too easy to modify scanners. It was clearly Congress' intent to stop the manufacture and importation of cellular-blocked scanners that, once purchased by consumers, can be easily modified to receive cellular frequencies. Most of the examples given in our definition of scanners that can be "readily altered by the user" are modifications that perhaps could not be done by "non-technical consumers." Yet, they are examples of precisely the kind of easy modifications that we believe the TDDRA was intended to prohibit. While we appreciate Kenwood's concern that manufacturers may need more guidance on the definition, we do not believe that restricting "readily altered by the user" to include only quick changes made by "non-technical consumers" is appropriate. Nevertheless, to the extent that Kenwood, or any other manufacturer, has specific questions as to whether or how the rule applies to its particular product or situation, it may request an interpretation from our staff. Such inquiries are encouraged and, consistent with our longstanding policy regarding the Part 15 rules, we will allow our equipment authorization staff to interpret, on an ad hoc basis, how these rules will be applied. Accordingly, we are rejecting Kenwood's request.

ORDERING CLAUSES

13. In accordance with the above discussion and pursuant to the authority contained in Sections 4(i), 302 and 303 of the Communications Act of 1934, as amended, and the Telephone Disclosure and Dispute Resolution Act, IT IS ORDERED that the Petition for Reconsideration filed by Kenwood

Communications Corporation IS DENIED.

Return it, and try out a Trident/AOR/Camnis rig (if you must buy in the
US, have return privileges, and continuous wideband coverage) in your own
RF environment.

True, any wideband scanner is going to have intermod problems to some
degree. But the R1 is below the norm because a great deal of it results
from mixing products from INSIDE. The synthesizer in this radio is very
noisy, and spurs from the synth get mixed into one of the IF stages. This
creates images of signals many kilohertz away. There used to be a
third-party (UK) fix for this, but the company producing the filter
upgrade no longer exists.

A lot of the 800 MHz radio services are in spectrum reallocated from old UHF TV channels that were never used. Would not be surpised if your could also hear trunked systems.

I've got mine from Radio Lorenz in Montreal for $750+7% taxes + smth. for
delivery. $750 - in Canadian dollars. That was a few months ago.
Here in Toronto similar stores selling the same model for stupidly high
prices - $850CDN +15% taxes for Ontario residents.
I told them that they're losing the whole North American market because
of their prices, but he didn't pay attention.
As a result - my advice to call: (514) 392-9200 Radio Lorenz.
And don't forget to get a case for it. I've got a vinul case and quite
satisfied with it. Although it costs additional $39CDN.

The poor selectivity of the R1, plus high noise floor from synthesizer noise
is well known over the net. I live in a high RF area of Kansas City, and
the R1 was not very useful in my environment. You may want to throughly
test the unit on your favourite frequencies during your trial period. I
found the R1 too broad and lacking in selectivity to be useful as a scanner.
It would just lock stop on nearly all off band frequencies.

ITINERANT FREQUECIES
Itinerant Frequencies are used for operations which may take place
anywhere in a given state or even anywhere in the country. Portable
radios, pre-programmed or crystallized with itinerant frequencies
are now widley avaialable. Often users will not license themselves.

33.14 154.570 464.500
35.04 154.600 464.550
43.04 158.400 469.500
151.505 451.800 469.525
151.625 456.800

DOT FREQUENCIES
==========
Some land mobile radio companies mark their radios with
dots or stars to indicate what frequency the radio is
tuned to. Below is a list of common designations.
Black Dot 462.6250
Blue Dot 154.5700
Blue Star 467.9250
Brown Dot 464.5000
Gold Star 467.8750
Green Dot 154.6000
J Dot 467.7625
K Dot 467.8125
Orange Dot 462.6750
Purple Dot 151.9950
Red Dot 151.6250
Red Star 467.9000

Is there is list, FAQ or other document which lists state by state,
the rules for mobile scanner operation? I plan on taking a trip
this fall and will be covering most of the western and southern
states. Hopefully, complying with the laws..

Also, use of radar detectors, listed by state would be a plus!

Thanks..

Just walk into your nearest Rat Shack store and tell them that you'd like
to special order the service manual for the PRO-2022. Even though my '38
has been discontinued for a while, I was able to order a service manual for it.
It takes about a week to come in but it covers just about everything you'd
even care to know about the guts of the scanner.

Probably not - otherwise everybody would be desoldering diodes in their
2006s instead of clipping them. There's probably a 'including, but not
limited to' clause in that ... somewhere. Anyway, I doubt that Rat Shack
would hang their corporate ass on the line to test a technicality.

The 200x series of scanners DOES require some hardware since it doesn't come
with a way to hook the serial cable to it. The ads you see for 2006 sofware
are programs that will run on popular hardware kits like the Opto-456 or HB232
interface kits.

The last I heard, they were in the process of (or had just passed) laws out-lawing reception of images, and receivers capable of receiving these images. Big business has the politicians in their pocket.
I guess they forgot about the old TV's that go up to CH.83. Next thing you know, they'll be going house to house confiscating these too.
Don't they realize by now that they are only making cellular monitoring more appealing, popular, and wide-spread with this witch-hunt? Have they forgotten 2 Live Crew already? I did the mod on my Pro-43 only after I started hearing about the controversy. That's human nature. Forbidden fruit! Found out there wasn't much interesting on there after all, besides the occasional drug deal. Sayyyy! Let's complain to the government about how the cellular industry is facilitating illegal TRANSMISSIONS and see how far we get.
Point is, the government is wasting their time and our money with these oppressive laws. Nazi Germany out-lawed radios under penalty of DEATH and that still didn't stop people from firing up that home-brew in the cookie-tin.

Stick me with a fork, I'm done.

[PR Docket No. 91-36; FCC 93-410]

Federal Preemption of State and Local Laws Concerning Amateur
Operator Use of Transceivers Capable of Reception Beyond the
Amateur Service Frequency Allocations

AGENCY: Federal Communications Commission.

ACTION: Declaratory ruling.
..

SUMMARY: The Commission has adopted a declaratory ruling that
states that certain local and state laws are preempted by federal
law where such laws prohibit the mere possession of certain
amateur service transceivers that are capable of receiving frequencies
assigned by the Commission for, among other things, police use.
This action is necessary to prevent overly broad scanner laws
from frustrating the federal goals of facilitating and encouraging
amateur service activities. This action only protects the legitimate
operations of amateur licensees and does not apply to narrowly
tailored state and local laws that prohibit the use of such
radios for criminal purposes, such as the flight from law enforcement.

I am looking for any mods as well, particulary if there is a filter to stop the hum comming out the External Speaker port when the backlite is on. Also it seems very susceptable to noise, I could move my headphone wire to one particular place and it would cause the scanner to stop at one frequency.

6857. Modifying mutliband scanner antenna

Newsgroup: rec.radio.scanner
Date: 1994-07-26 13:36:52 UTC
From: domonkos@access.digex.net
Message-ID: <z$GDkiubGA7T066yn@access.digex.net>
Source record: 271304

I'm posting this as a result of all the e-mail requesting how to modify
the Radio Shack multiband vertical scanner antenna:

I used the formula 234/freq(in Mhz) for the element length. I compromised
and cut mine for the middle of the band (250-400Mhz> approx. 325Mhz). (Note
at VHF/UHF this formula loses accuracy but for scanner wide band use it works
out very well).

That gives me an element length of 8.6 inches for the 325Mhz center
frequency and 3 inches for 870Mhz (cellular). I went to the local h/w
dept store and bought 3/8 inch diam. aluminum tubing and a small strip of
sheet aluminum. I used self taping screws to attach the tubes to the strips
and then attached the strips to the original radio shack scanner antenna
the same way the existing vertical elements were attached. I noticed an
improvement in the military control tower and cellular traffic
after I added the elements (I am using Belden 9913 coax, about 40 feet,
to the scanner. This gives you the lowest loss at UHF).

The discone's advantage is it gives you a much broader bandwidth than the
multiband scanner antenna but I like the extra gain the multiband offers.

Good luck, you'll be pleased w/it as I am...

Andy

ICOM R1 INTERMOD PROBLEM

I find that turning the squelch on full and using a small, 2-inch antenna designed for 440 MHz reception both limits the interfering signals and helps to some degree with the "stopping on nearby frequency" syndrome. Meanwhile, my reception is still very good on other bands even with such a small antenna, and there is the added convenience of an even more compact receiver!

>triple-conversion, or other desirable features?

>The RS-2036 appears similar to the Bearcat 890XLT scanner.

It is the 890 made by Uniden. double conversion. The only change I know of is that the RS model has less audio output than the Uniden. The tone board will also be available. I have heard Rf performance is not too hot (the tone board would solve some of this problem. It hing RS is charging $319 or something for it. For that money, you could do better.

Does anyone in Texas have information on where to get an updated copy of
the Far Point BBS Frequency report?

Back in 1991 I logged on to this BBS and got this huge ASCII file with
all frequencies in Texas broken down by county.

Any ideas or is there something similar?

RS sells an amplified speaker that will plug into the earphone jack. Or, if
you like to tinker, you can buy an audio amp IC and build your own amp and
hook it to a non-amplified speaker.

Did anyone see the piece on GMA yesterday about the "Code Grabber"? It is a device that scans the freq.s used by auto alarm systems and door openers, records their coded emmissions and then can retransmit them.

One way to defeat this type of system would be to have your alarm system "passivley" arm and lock the car for you so the only time you xmit is when you are arriving and disarming.

Well, the 34 does not have hyperscan or the 220 band and is larger than
the 43. Also, the 34 is not triple conversion. Lots of differences!
But, I agree with the statement that the 43 is a good deal at $200 if
you can really find it for that price. The 34 isn't worth more than
about $150 these days.

Phil,

No such thing as a stupid technical question. You won't need to ground the antenna at the installation location in your attic. I have all my amateur radio and scanner antennas mounted in the attic. I do use a static discharge coupler in line at the receivers just to disipate static build up, but that's optional. I use a Radio Shack mutliband vertical w/great results (my house is on a hilltop and the line of site is excellent). What a difference compared to the stock whip antenna!

August Monitoring Times has a full page ad by Ramsey Electronics that features the scanner converter. It is legal for sale.

BTW, make sure all your lead connections are as short as possible. The converter will work better. I own a GRE scanner converter and use it with my Uniden Bearcat 210XLT and am very please w/it.

>
The Pro-34 was shack's first 200 channel hand-held unit
It was followed by the Pro-36? 37? (same as Pro-34) with Hyper-Scan

The Pro-43 is a new style, slimmer case and it is shack's first hand-held
that has the Military UHF Air band (Great for military air show fans) I
usually mount my Pro-2005 in my car for air shows etc, because I haven't
bought the 43 yet. I believe this was in response to AOR and others that
were selling units with the Mil A/C coverage. RS scanners are the only
ones easily found up here in the Great White North (every mall has RS)
but AOR, Bearcat, Uniden etc... Are a bit harder to locate.

: of an elephant's nose and a thing to pack for a long trip, but this radio
: definition eludes me. Is it just tones for automating a radio network,
: or can you make something of listening to "trunks" (whatever they are)?

Think of standing in line at a bank. Instead of one line of people
standing behind EACH teller, there is just ONE line, and the next
person in line gets the next teller. This distributes the work load
evenly between tellers, and makes most efficient use of their capability
(theoretically). That's a form of trunking. I really do not know
where the word "trunk" comes from in this context, except that
my dictionary defines it as a "direct line between telephone
switchboards". I suppose metaphorically you could picture a
"tree trunk" supporting many smaller "limbs and branches and leaves",
which is kinda what radio and telephone trunking does. OK, OK, I'm
reaching on this one. Anyway.

With telephones, when you dial long distance from New York to Miami,
there is not a direct line between your phone and the person in
Miami. Locally in New York, you are connected to one of many "trunk"
lines that go to Miami. In other words, when you call Miami from
New York, you are given the next available "trunk" line to Miami,
automatically. This by the way explains why calling into LA during
a earthquake is impossible - all long distance trunk lines are in
use with people calling to see how friends/relatives are doing.

Now in radio, the same holds true. Trunking in radio communications
simply assigns the radio to the next available frequency in the
pool of frequencies allocated to the agency using the radios. This
is done with cellular phones. Rather than have 1 frequency for each
individual car phone, there are bunches of frequencies shared by all,
and when you make your car phone call, you are given the next
available frequency in the pool, i.e., you have been trunked to the
next available frequency. Just like the bank. Increasingly, police
departments are using trunked systems where no single radio uses the
same frequency all the time, rather, they are shared. This makes
more efficient use of frequencies when a group (fleet) of radios
is being used. Needless to say, trunking is almost nightmarish to
follow with a scanner because you never know what frequency the
person you are listening to will be switched to next.

The switching of frequencies is done by a central computer over
one of the frequencies, called a data channel. This data channel
sounds growly on a scanner, but it tells all the radios (in a police

department, or a cell phone area) what freqency to shift to next.
When in an idle state, cell phones, police trunked radios, etc, all
revert to listening to the data channel. Kinda like standing in
line at the bank, waiting your turn until the teller "waves" you over
or yells "next in line".

This description leaves out considerable detail about how handoffs
and so forth are handled, but it gives you some idea.

Check out the good description of trunked radios in Police Call.
You can get it at Radio Shack for about 11 bucks. Worth it.

Hope it helps.

Mike

I did. Pretty nifty device. (From an engineering standpoint...)
I keep thinking of the great fun I'd have using it on my brother
(Who sets the alarm even when his car is in the garage... we live in
an area that I consider to be relatively out of the way to burglers....
no thefts in the past 20 years I've lived here.) (Knock on wood...)

: One way to defeat this type of system would be to have your alarm system
: "passivley" arm and lock the car for you so the only time you xmit
: is when you are arriving and disarming.

I was thinking that a narrow width (less than 5% beam spread) IR beam
that you would have to point directly at the vehicle would do the trick.
But, I like your idea better.

Isn't it funny that they made a point of the item being so new that
many potential burglers don't know about it... and they hope to be able
to squelch the product before it becomes in mainstream use by burglers?
Here's the irony: This was broadcast on national television.... go figure!
Plus, they even listed the magazines in which you can find advertisements
for the device. And then proceeded to do a pretty lame '60-minutes' type
of interview, trying to catch the manufacturer in a catch-22 situation by
setting him up.

Disgusted with journalism,
Paul

Whenever a statement starts with "The last I heard, they..." I
question it. I'm not saying that Mr. Banks is full of crap or
paranoid, but since the ECPA says

(4) "intercept" means the aural or other acquisition of the contents of
any wire, electronic, or oral communication through the use of any
electronic, mechanical, or other device.

There would seem to be no reason to outlaw image reception since the
wording is sweeping, i.e., "through the use of any... device".

It's amusing to me. You elect these people and then gripe about what
they do to you. You deserve what you settle for.

: 151.505 451.800 469.525
: 151.625 456.800

Not exactly. 33.14, 157.570, 157.600, and 469.525 are not itinerant frequencies...the first three are business-band low-power frequencies.

The difference is subtle but distinct. Itinerant frequencies can indeed be used anywhere at any time by the licensee; however, they are not limited to 2 watts. They can run full-blown bases, repeaters, and mobiles (with restrictions on base antenna heights). Low-power business frequencies, however, are limited to 2 watts. Users are also licensed for a limited area and have restrictions on antenna placement.

In addition to the "dot" frequencies, all frequencies in the 450-470 MHz band ending in .xx25 and .xx75 (the "split" frequencies) are low-power (2 watts) and licensed to the user of the next full-power frequency.

Here is the list that I have (compiled from sources both on and off the net):

Hi. I'm a ham who doesn't scan much.. My friend just got a scanner
and has been hearing TV audio up around 900Mhz. It doesn't make any
sense to me. Can somebody explain what he's hearing and how?

Also, is there a FAQ for this group?

email please. Thanks.

You might add, Brett, that the Shuttle _UPLINKS_ to TDRSS, which then _SIDELINKS_ to the TDRSS above White Sands, New Mexico, which then _DOWNLINKS_ it to White Sands TDRSS Ground Terminal. The following is an article posted to amsat_bb about the path HST images take, but Shuttle audio is digitized and follows a similar, tortuous path.

From: SCHULTZ@CDDIS.GSFC.NASA.GOV (In space, no one can hear you snore)
Subject: Hubble Space Telescope Image Reception

"I have answered this question in private for several persons who have asked
about it in the past, maybe it is worthwhile to post it for general distribution.

Several amateurs have asked about the possibility of receiving and displaying
data from the Hubble Space Telescope, reasoning that if you can receive and

display pictures from weather satellites using simple equipment, it must be

possible to do the same for HST. I wish I could say that this was easy to do,
but the fact is that while the weather satellites were designed to be easily
received with simple equipment, HST was not.

Science data from HST is usually stored on a tape recorder on board the spacecraft and dumped to the ground at sporadic intervals at the convenience
of flight controllers and the Tracking and Data Relay Satellite network (TDRSS). There is a real-time capability, which is rarely used except to support interactive target acquisitions. Data dumps from the tape recorder are at 1024 kilobits per second, using the high-gain antennas on either side
of HST, which are aimed upward toward the TDRSS satellite in geosynchronous

orbit. The data is received by TDRSS using the S-band single access (SSA) antenna at a frequency somewhere around 2255 Mhz. Since quite a few Earth orbiting satellites use TDRSS, the scheduling of the SSA antenna for data dumps can get complicated, especially when a Space Shuttle is also in orbit.
>From the TDRSS satellite in geosynchronous orbit the science and engineering data is sent to the ground station at White Sands, New Mexico by a KU band space-to-ground link operating somewhere between 10 to 15 Ghz. Data from White Sands then is sent to Maryland through a commercial satellite on which
NASA leases transponder service.

Now for the hard part.... The signals from HST (and all the other satellites
that use TDRSS) are convolved with a pseudo-random binary code unique to each
spacecraft, which is done for several reasons: 1. It disperses the signal over a wider bandwidth to prevent interference to or from terrestrial microwave systems on the same frequency. 2. It allows the ground system to do precise ranging to each satellite to derive tracking information and orbital elements. 3. It allows the ground system to sort out the signals from the many satellites that use TDRSS through Code Division Multiple Access,
and 4. It encripts the signal to discourage evesdropping. There is a more complete discription of the TDRSS coding scheme in the final chapter of the

book "Spread Spectrum Systems" by R. C. Dixon. The PN codes for non-classified
satellites are available in an obscure NASA document, but you would still need
to build a lot of specialized equipment to recover a useful signal. Since the
antenna onboard HST is aimed upward toward the TDRSS satellite, it would not
be possible to intercept this link from the ground. If you live close to White Sands, New Mexico, you might be able to intercept the KU band space-to-
ground link from the TDRSS satellites, but I would hate to think about the complexity of the equipment that you would need to recover HST data from the
megabytes of data that flow on this link. If you did succeed in recovering data, you would then have to decode the Reed-Solomon error correcting code and a second level of PN coding whose purpose I never did understand. Then each of the four science instruments has its own data formats, for the Wide Field and Planetary Camera it is relatively simple, 3200 data packets per image, 800 packets for each of four CCD chips, with each packet containing 800 pixels in a single line of the 800 x 800 pixel image for each chip, with
12 data bits per pixel for 4096 discrete levels of gray. You would then have
to apply flat field and bias corrections to correct each pixel for different

photometric response and remove cosmic ray hits which pockmark the raw images.

If you can figure out which commercial satellite NASA uses to relay the data
from New Mexico to Maryland, you might be able to receive the downlink from

there if you live close to the footprint. I have no idea which satellite is

used, anymore than I know how my long distance telephone calls are routed, we just put the data into one end of the pipeline at White Sands, and it comes out the other end at Greenbelt. I don't know if those signals are encripted or what format they use, and if you figure out which satellite and
transponder is used, there is no guarantee that it won't change a week after
you find it. It would probably be a real mess to sort out the NASCOM data blocks from all the other commercial traffic on the satellite.

I work at the Hubble Control Center at Goddard Space Flight Center, and I don't even get to see the images anymore, since the astronomers folded up their tents and moved to the Space Telescope Science Institute in Baltimore

several months after launch. The astronomers like to keep the data "proprietary" for a year or more, since they are all sure that there is a Nobel prize buried somewhere in the data. This probably explains why the general public thinks that HST is a complete failure, since they rarely see

any of the images that it produces. There is an FTP site at the science institute which allows you to download some of the public release photos, if you have internet FTP access.

Dan Schultz, N8FGV
Space Telescope Operations Control Center, Greenbelt Maryland

schultz@cddis.gsfc.nasa.gov
n8fgv@amsat.org"

Replace 'HST images' with 'STS audio/video' and you get the picture.

6892. PRO-51???

Newsgroup: rec.radio.scanner
Date: 1994-07-26 20:43:48 UTC
From: Soren Ragsdale <soren_ragsdale@path1a.med.upenn.edu>
Message-ID: <313si4$nr5@netnews.upenn.edu>
Source record: 271133

My local rat shack salesman tells me that he's selling a PRO-51 scanner. 200 channel with 800Mhz coverage. (Of course, the cellular frequencies are locked out.) He says that this one is easily modifiable like the others. (Kind of an open salesman, eh?) These scanners are going to be on sale for $200 at the beginning of next month (discounted from $300), and I thought I'd take the opportunity to buy one.

Does anyone know whether this new model is easily modifiable (like the old ones), or how I could tell (looking at the product code to see if it has an "A" in the beginning)?

Also, what's rat shack's return policy? If I buy it and I find out that it's nonmodifiable, I'd like to be able to correct my error.

Thanks to everyone in the group for the plethora of information that I've already gotten.

Assuming that the BC200XLT has a standard earphone jack (you can always get an adapter if it doesn't), I'd suggest going to a computer store and buying a pair of amplified speakers designed for connecting to a computer. These connect to the headphone jacks of several different types of equipment, including CD players, walkmans, computers, etc., and provide good sound.

Here's some stuff to look for:
Make sure the speakers take batteries. This means that they are amplified. They will probably also have a separate volume control.
You might want to look for a pair of speakers that connect into each other so that you can disconnect one of the speakers if you don't want to lug two of them around with you. (If you do want 2-speaker sound, you may need to purchase an adapter to convert mono-to-stereo if your scanner doesn't already do this.)
You can get some decent speakers for around $20-$30.

I heard it mentioned somewhere that a freq counter (about $99) from radio shack could be used to aquire freq from people transmitting close to you. How is this done and is the freq counter all that is needed? What kind of limits (1 Hz to 1G Hz ?) and range does it have. Could I follow a cop and tell what freq they are Txing on? or maybe park at the station and get all the freq?

6903. Handheld Scanner Recommendation?

Newsgroup: rec.radio.scanner
Date: 1994-07-27 02:42:02 UTC
From: jim@ttech.com
Message-ID: <jim-260794184202@jimsmac.ttech.com>
Source record: 271162

I have recently purchased a new ICOM R-1 and am very displeased with the intermod, front end overload, and general bad performance. I am going to return it this weekend and obtain a refund. I have a Radio Shack PRO 2006 base scanner that I am very please with. Would you have any recommendations regarding a good handheld scanner? Cellular coverage is of interest, but not mandatory. I am considering the following scanners:

1. Radio Shack top of the line (I think the model number is PRO 43)

2. AOR 1500

3. Trident (I do not know the model numbers)

4. Bearcat (I think the model number is 2500, it is the replacement for the 200xlt)

5. Yupitero MVT7100

Please give me your recommendations and opinions on these and any other scanners that are worthy of consideration.

thanks,

-Jim

Scanners w/out receiving images? If you're serious than our politicians
and the lobbies pushing them are bigger dum-asses than I previously
thought! You can do it, at a HUGE cost!

Rob,

I haven't noticed any hum in my ext. speaker. You may have a marginal
power supply filter capacitor. You may want to try an external 12V battery
on the scanner to make sure.

In article <CtKpxJ.Awo@metronet.com>, copeland@metronet.com (Charles Copeland) writes:

>Just what does the epca say?

Below is quoted from the 1993 volume of police call. If you don't mind waiting a day or two, I was planning on getting a copy of the ECPA myself.

"The rules are spelled out in the Communications Act (ECPA) of 1934 and the Electronic Communications Privacy Act of 1986. The Federal Communications Commission (FCC) maintains a staff of investigators throughout the country, and the FBI is also empowered to investigated violations, and make arrests, when warrented. The laws provide for monetary fines and/or prison sentences of as long as ten years.

"Regarding radio transmissions that you hear, it is illegal to:

"* Reveal to any other person, not a party to the transmission, the contents of those transmissions (in other words, keep it to yourself).

"* Use any information heard to aid in committing a crime.

"* Use any information heard for personal gain.

"Federal law makes it a crime to intentionally intercept the following types of radio transmissions:

"* Remote radio-TV broadcast pickups.

"* Scrambled, encrypted, or coded transmissions.

"* Mobile telephone conversations of any type."

I think it was a Rhode Island desicion that allowed monitoring of cordless phones. Be advised of the law, and try not to be too blatant about breaking it. We all joke about bumbled dispatches and our crazy neighbors, but let's not get carried away (to jail).

Cross-posted to: rec.radio.scanner,alt.radio.scanner

In my continued pursuit of a good handheld, I'm coming across distinctions in frequencies: some radios get frequencies that others don't. Military bands in particular. What are some bands that I should look for when I buy a scanner to make sure that I'll have a more or less full band to listen in?

6914. Time to get the OS456?

: ACTION: Declaratory ruling.
: ..
: --
: SUMMARY: The Commission has adopted a declaratory ruling that
: states that certain local and state laws are preempted by federal
: law where such laws prohibit the mere possession of certain
: amateur service transceivers that are capable of receiving frequencies
^^^^^^^ ^^^^^^^ ^^^^^^^^^^^^
: assigned by the Commission for, among other things, police use.

[Bandwidth deleted from previous post...]

Essientially what the FCC said was that the states didn't have the right to
restrict the legal use of equipment approved by them, and used in the
legitimate pursuit of individuals licensed by the federal government.
Unfortunately this didn't provide a blanket coverage protecting the
right of 'Joe Citizen' to use a "scanning receiver" as defined by the FCC.

Too bad. I think we ought to be allowed to listen to anything that is
broadcast on any frequency so long as it is in the clear.

6918. Pro 2026 image problems: do you have?

Newsgroup: rec.radio.scanner
Date: 1994-07-27 08:22:20 UTC
From: thooker@psl.nmsu.edu
Message-ID: <thooker.42.00085F95@psl.nmsu.edu>
Source record: 271243

I recently purchased the Pro 2026, the 100 channel mobile scanner from radio shack. I liked its small size, and the attractive price (135 mail order). I have been using it for a little over a month, in a medium sized city, and in the county. My observations are that the radio has absolutly NO image rejection. I do not believe that it even has front end filters, judging from the complexity inside the case!

Here is an example: While on a trip to Arizona this week end, I began recieving airline chatter on a local police channel. The frequency I was tuned to was around 157 MHz, but I was hearing airlines. So I tuned down into the air band by subtracting twice the IF frequency from the 157 channel, and there it was. Airline traffic.

I have also noted that the radio is basically useless when doing a search in an RF rich envionment. It stops on a frequency, makes funny noises, and has terrible intermod problems.

I know that the radio is operating properly, and is not broken. It is simply a poor design, with too much emphasis on cutting cost, and not worring about performance.

When compared to my old Bearcat 220, it is a shame.
That scanner has a front end filter which tracks electronicly with the radio tuning, and this eliminates a lot of garbage.

If you are considering this scanner, I would like to steer you away from it. These problems are not just confined to a large city, as indicated by my experience on the hiway. It really cripples a scanner, to have these problems.

I do not know if RS will take it back, but I am going to try. I am going to look at the Bearcat 760. It looks to be almost the same outside, but I am hoping the higher cost will include more design effort and a better product.

I hope this helps somebody make the proper decision!

>August Monitoring Times has a full page ad by Ramsey Electronics that
>features the scanner converter. It is legal for sale.

How are you sure that such a converter is legal for sale. The fact that a company is selling it does not necessarily make it legal for sale. It could mean that Uncle Sam's attention has not yet turned to that company.

I think converters should be allowed, but the FCC differs with me on that. Here's what they said in April of last year:

"We recognize that frequency converter designs are typically not very sophisticated compared to those of scanning receivers, and that banning frequency converters capable of converting cellular transmissions will significantly increase the design complexity necessary for converters to comply with our technical standards. We further recognize, as several commenters note, that there are very legitimate uses for converters that convert 800 MHz and 900 MHz signals down to lower frequencies. Even though the restrictions we proposed for converters will undoubtedly make it more difficult and expensive to purchase 800 MHz and 900 MHz converters for legitimate purposes, we believe the intent of the TDDRA leaves us no choice but to adopt them."

Back when I used to work at Kinko's Copies, we had this same type of annoying music. They played New Kids on the Block a lot. Except that we crafty employees found the volume know and would turn it off whenever the manager wasn't around and then go for a portable radio with the music of our choice.

Well, one day I poked around the area of the mysterious knob on my break and found what looked like a radio reciever hooked to the amp, with some coax leading from the reciever up into the false cieling.

So, I suppose such broadcasts of annoying store/elevator music are broadcast. But then how do they insure that stores pay for the service? Honor system? And what if you want Muzak in the middle of Montana?

--Nick

PS...apologies to all Montanans, but I found your state very beautiful but desolate, in a green sort of way.

My brother-in-law bought an BC8500XLT a few weeks ago and was extremely disappointed w/ the aircraft range performance. Namely spurious feedback and intermod. He tried to return it to the mail order place he bought it thru and they essentially said "too bad, address any issues w/ uniden". He called uniden
and they directed him to send in the unit for "free repairs". He got it back yesterday in its original condition, w/ uniden claiming to have found nothing wrong w/ the unit. He then again tried to return it to the place of purchase, and they said they'd refund the money.

Just a little anecdote for any of you considering buying the 8500.

I did buy an 890XLT and am pretty happy w/ it.

I just picked up the 890 by Uniden and it is superb. I live 25 miles north
of Baltimore and use a multiband vertical scanner antenna w/excellent results
and the minimal of image overloads. This model can be had for about $250
at most suppliers (ie; Ham Radio Outlet, etc). I may go to RS for the
tone board only.

If it falls on your property than you should have the right to receive, etc.
Keep it off my property if you don't want it received. As long as an
individual isn't commercializing or abusing the information he receives
there's no harm. If anyone is telling me I still don't have the right
to receive (demodulate) the signal then they're a freaking fascist/communist.

Too many groups in this country getting too comfortable dictating to
supposed 'free' people what the hell to do...

Here in Santa Barbara County the Sheriff's Dept. "talks" to the CHP this
way. Typical is, "SO Nora 10 to CHP unit at Fairview on scanner. Suspect
vehicle is two ahead of you".

A few months back, a friend of mine, accidentally over-heard in the 152MHz Police bands in the UK (purely making sure his Amateur transmission on 144MHz wasn't going out of band, as Public monitoring in the UK is ILLEGAL!) an un-marked police car following a suspected stolen vehicle. Backed up by Helicopter, and several marked cars.

Turns out the poor chap had just left his wife and she reported the car stolen!

Not a good way to patch up a relationship !

For the technical bods: AOR3000, using a Discone mounted in the loft. Controlled by Scancat software.

Tech Question: Does anybody else still get their AOR locking up, requiring a total System reset?

This model may not be around much longer. It has a FCC certification after
the magic cutoff date and does not meet the non-cellular criteria. Radio
Shack is in violation for selling this unit and could be in hot water soon.
The FCC is looking into it now. I would get one while still on the shelf if
you are interested in this model.

Does anyone know of frequencies used by the Unlimited Hydroplanes? I have searched in the past with my radio and haven't found any. In about 10 days there will be Hydroplane races for Seattle's Seafair celebration and I thought it would be interesting to listen to the drivers and crews communicate. These races are held all around the U.S. so I think it would be of general interest.

Thanks for your help!

Chris, you can sometimes find it in the magazine racks at Barnes & Noble superstores. It's hit-or-miss as the magazine selection is apparently up to the local manager. It's usually next to Monitoring Times and Practical Wireless.

I considered subscribing, but apart from the ads there really wasn't THAT much more than the domestic (USA) mags to make it worth the cost for me.

Excerpts from netnews.rec.radio.scanner: 26-Jul-94 Code Grabber by Brad Glidewell@nRCHs022
> One way to defeat this type of system would be to have your alarm system
> "passivley" arm and lock the car for you so the only time you xmit
> is when you are arriving and disarming.

This issue has been covered in a car audio/security magazine that I saw. One of the ways to defeat the system that was pointed out was just what you said. But another good way is to go out and buy one of the (what I can call) "anti-code-grabber" alarm systems. There are several available. These usually work by using a different code each time. Simple, eh? Each new code is calculated from the previous code according to an algorithm that both the transmitter and the receiver of the alarm system know. It works much like a random number generator on a computer or calculator. So the codes appear pretty random. Of course, if someone can grab your code repeatedly and deduce the underlying formula, this could be defeated too. But that would take a hell of a lot more effort.

I work in the University of Pennsylvania hospital. What might I find interesting around here? Does anyone know the specific frequencies?

Apart from just listening to interesting things, are scanners really _useful_? For instance, getting police reports on traffic or finding out which parts of town aren't a good idea to go into at night because of crime. Scanners sound fun as a toy, but if they could help me out as well that'd be better.

: --

Mike,

Physically, about all you need to do is get a gender-mender (adaptor)
to go from the CB antenna PL-259 connector to the BNC antenna jack
on your scanner.

Now, also remember the CB antenna is specifically tuned to the
CB range of 26-27MHz, whereas your scanner picks up 30MHz to
near 1GHz. So, the tuning will be off technically speaking.
But, given that it's a long piece of wire sticking off the top
of your car, you will still probably get a lot better reception,
at least in VHF low (e.g., cordless phones 46-49MHz) than the
rubber duck inside your car. You may find that UHF and 800 band
stuff may not come in as good as the duck, since the CB antenna
is nowhere near being tuned in that range. I have found that
a window clip-on cellular phone antenn does a fine job on MY scanner
for picking up UHF and 800 band, not surprisingly. I got a TNC to BNC
adaptor for the antenna jack. Your mileage may vary.

Hope it helps.

Mike

4) Why is it that the same people who insist that the government is always trying to take away THEIR rights give absolutely no considerations to anyone else's rights. Allowing individuals to monitor confidential conversations is probably worse than allowing the government to do it.

If people want confidential conversations, then they should encrypt the conversations, and the govt. should let them do it. Instead, the govt. has taken away *everyone's* right to monitor signals that pass through their environment (and even through their own bodies!).

The govt's solution of making it illegal to monitor certain freq's is not only completely ineffective, but it also takes away _everyone's_ right to monitor signals in the _privacy_ of their own homes.

Why don't those who can afford cell-phones, for example, get off their lazy butts and use existing, conventional technology to encrypt conversations which they consider confidential? They are the ones who have no consideration for anyone else's rights.

Why should _everyone_ have their rights taken away so that a fraction of people can be lazy?

: station and get all the freq?
:

Tim,

I've got a Radio Shack RF Frequency Counter, and it works with the
telescoping antenna that comes with the device. You can be near
just about any radio transmitter and it should register the frequency
when it transmits. Only drawback is that it does not have a hold
button so you can't easily make note of the number. However, the unit can be
modified (I did it, it works) to have a hold button. The unit
measures 1MHz to something like a couple GHz, I don't exactly
remember the high limit (the unit's at home). I got it for
under $100 bucks at Radio Shack. Good unit, well built, feels
good in the hand.

This model has nice features but poor RF performance. Deafness among the
deficiencies. If I'm not mistaken the model was withdrawn (along with the
2500XLT) because of overwhelming performance problems.

Only two things might be of interest. One would be the local pagers which might not even contain voice, and the hospital police. There are lots of places to look; usually at or near itinerant business frequencies, or VHF freqs allocated to ambulances.

Not very exciting listneing.

I'm going to be driving some friends of mine up to the Lolapolooza concert here in Detroit (at Pine Knob I think) this Friday and decided that I'm going to take my scanner up there and perhaps bum around the parking lot. Any idea on what frequencies I might find the wireless microphones so that I can listen to the concert? Perhaps a frequency where everything is mixed together? Any ideas are appreciated.

For a list of the FCC frequency allocations, check the file fcc.allocations
at oak.oakland.edu:/pub/hamradio/docs/misc.

A condensed list of bands with purchase priorities (opinions may vary) -

A 30- 50 mobile radio services
B 50- 54 amateur
54- 88 TV ch 2-6 (WFM)
88-108 FM broadcast (WFM)
C 108-136 aeronautical (AM)
A 138-150 US Govt / amateur
A 150-160 mobile radio services / maritime / railroad
A 162-174 various, mainly US Government
174-216 TV ch 7-13 (WFM)
B 216-225 maritime / mobile / amateur
C 225-400 miltary aeronautical (AM)
A 400-420 US Govt
B 420-450 Amateur / military radar
A 450-470 mobile radio services, etc
B 470-512 TV ch 14-20 / public safety in certain cities
512-806 TV ch 21-69
B 806-824 mobile radio services (mobile freqs)
824-849 cellular (mobile freqs)
C 849-851 aircraft phone (mobile freqs) (AM)
A 851-869 mobile radio services (base)
869-894 cellular (base)
C 894-896 aircraft phone (base) (AM)

A minimum requirement
B desireable
C aero bands use AM, available only in better scanners

6950. Question about antenna in attic

Newsgroup: rec.radio.scanner
Date: 1994-07-27 17:18:05 UTC
From: lavoie@bosserv.bos.locus.com
Message-ID: <3164sd$1j2@lccma.bos.locus.com>
Source record: 271250

I recently bought a new house and need to set up my all band antenna. My wife does not want it on the roof (complaints about it looking ugly), so I was thinking about mounting it in the attic.

The roof currently has two layers of shingles on it, so there are a lot of nails in the roof. Will this have any effect on the performance of the antenna?

Thanks for your input.

I just a line on a used pro-39. Does anyone have a manual that they
would be willing to copy and share with me?

Of course I'd be willing to pay whatever expenses are needed.

Are operation manuals or mod manuals available via ftp?

How about channel tables?

Concerning "cheap" places in Canada for unblocked scanners, I went to
Dubberlies on Davie in Vancouver BC recently. Looks like a quality
shop, but the prices for the Yupiteru MVT 7100 was extravagant, in
the order of $CDN 900. Add to it GST and PST, and the price gets
to be over $ 1000. Definitely not "cheap", as the radio was selling
for $US 495 before the law was passed.

I found a battery operated scanner *very* useful before, during, and
after a tornado which killed 26 people and wrecked my barn a few years
ago. There was no warning broadcast on AM/FM radio or TV, but I heard that
the tornado was coming about 2 minutes before it hit me by listening to
the county sheriff. We didn't have electricity restored until 12 hours after
the tornado.

In winter, I find the mobile scanner good for learning which rural
roads are closed. Same thing during heavy rains and flooding.

Since local newspapers and radio/TV doesn't provide thorough nor accurate
coverage of events in my area, I rely on the scanner to find out some of what's
happening -- while it's happening or by taping transmissions and playing
them back later.

6955. Pro-51 Bands

Newsgroup: rec.radio.scanner
Date: 1994-07-27 18:32:12 UTC
From: Soren Ragsdale <soren_ragsdale@path1a.med.upenn.edu>
Message-ID: <31697c$lc3@netnews.upenn.edu>
Source record: 271253
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Just got a list of bands that the Pro-51 will scan (officially without mods).

29-54 Mhz
108-136.975 Mhz
137-174 Mhz
406-512 Mhz
806-824 Mhz
851-869 Mhz
896-956 Mhz

Is this missing anything really crucial? Which bands are opened up with the software mod? Does anyone have the actual key combination for modifying it?

6956. Pro-51 Bands (longer)

By my figurings, here's a breakdown of the bands that the pro-51 can and cannot scan:

(If someone has information on which bands are opened up with the modification, let me know.)

Recieves (unmodified)

29-54
A 30- 50 mobile radio services
B 50- 54 amateur

108-174
C 108-136 aeronautical (AM)
A 138-150 US Govt / amateur
A 150-160 mobile radio services / maritime / railroad
A 162-174 various, mainly US Government

406-512
*A 400-420 US Govt
B 420-450 Amateur / military radar
A 450-470 mobile radio services, etc
B 470-512 TV ch 14-20 / public safety in certain cities

806-824
B 806-824 mobile radio services (mobile freqs)

851-869
A 851-869 mobile radio services (base)

Will not recieve (unmodified):

54- 88 TV ch 2-6 (WFM)
88-108 FM broadcast (WFM)

174-216 TV ch 7-13 (WFM)
B 216-225 maritime / mobile / amateur
C 225-400 miltary aeronautical (AM)

512-806 TV ch 21-69

824-849 cellular (mobile freqs)
C 849-851 aircraft phone (mobile freqs) (AM)

869-894 cellular (base)
C 894-896 aircraft phone (base) (AM)

A minimum requirement
B desireable
C aero bands use AM, available only in better scanners

In article <1632300013@cdp>, Dick Dillman <ddillman@igc.apc.org> wrote:

>Other abbreviations used by SFPD dispatchers include:
>
>IFO - In Front Of (a particular address)
>PAS - Premesis Appear Secure (often pronounced Premise)
>PASE - Premesis Appear Secure from the Exterior
>GOA - Gone On Arrival
>MEH - Mission Emergency Hospital
>T&O - Transfers And Orders (Typically by the wagon unit)
>PCO - Parking Control Officer
>Special - Patrol Special Police Officer

I listen to Security at Washington Square mall (464.475 MHz) which can be
very interesting at times. The more common abbreviations are:

UTL - unable to locate
DB - dead battery (i.e. customer has a dead battery and needs a jump)

rsa - where: r = { W (white), B (black), H (hispanic), A {asian) }
s = { M (male), F (female) }
a = { C (child), J (juvenile), A (adult) }

e.g. WMJ = white male juvenile

One thing you immediately notice is that they're right on top of any suspected
gang activity. They maintain a database of license plates of "suspicious"
cars and of cars of people that have caused problems. It's common to hear them
call in the plate on a car that looks like it might be a druggie's or gang-
banger's car. Once, the person monitoring one of the roof mounted TV cameras
radioed to a mobile unit that a low rider was coming up the south access road.
Sure enough, about 10 seconds later I spotted a little Nissan, lowered and with
tinted windows, cruising by. The mobile unit came up about 100 yards behind
him and read off the plate (the guy must have great eyesight).

Last month someone stole some expensive boots and they put out a description
of the guy and had everyone looking for him. I was just sitting in the lot
and figured, "hell, I'll look for him too". I drove around a bit, hoping I
could spot the guy. I didn't find him (and neither did they), but it would've
been amusing if I could've called Security and given them the location and
plate number of the guy they were looking for. Let them figure out how I knew.

6961. My $.02 on Scanner Laws

Newsgroup: rec.radio.scanner
Date: 1994-07-27 18:53:43 UTC
From: jksmith@platypus.atd.ucar.edu
Message-ID: <316afn$9mv@ncar.ucar.edu>
Source record: 271267

Owing to an operator error :-), I sent my original response to a post from someone who claimed that attempts to restrict what signals can be scanned are being done by "Fascists/Communists" to the sender rather than to the Newsgroup. Unfortunately, I no longer have his/her original message, but it contained a statement that said something to the effect of "If it crosses my property, I have the right to intercept it."

I have a few thoughts regarding this line of thinking:

1) As I understand it, property rights extend only to land and the buildings on it. They don't extend to the air above it or minerals beneath it, or in many places even to rivers flowing through it. Therefore, are radio transmissions sent through the air actually crossing individual property?

2) By this sort of reasoning, anyone would have a right to tap into any phone line that crosses their property.

3) If I dropped a $20 bill and it landed on someone's property, do they have a right to claim it? After all, I don't "own" the $20 bill, it was issued by a government agency, the Federal Reserve.

4) Why is it that the same people who insist that the government is always trying to take away THEIR rights give absolutely no considerations to anyone else's rights. Allowing individuals to monitor confidential conversations is probably worse than allowing the government to do it.

Jeff Smith

P.S. I apologize to the person who received a flame that was not intended to be personal.

The opinions expressed are mine and do not necessarily reflect those of my employer.

>hoping the higher cost will include more design effort and a better product.

Buy a PRO-2006 instead.

I owned three Uniden/Bearcat 760xlt scanners. You will find
the 760xlt behaves the same way as your Radio Shack (Uniden-made)
PRO-2026.

My 760xlt is used indoors, with an indoor antenna. Its sensitivity to intermod
precludes using an outdoor antenna. I exploit the 760xlt's ability to receive
images. My scanner has a TV audio image on 470.3125, so I programmed it
for 2 * 10.85 + 470.315 instead.

I like the 760xlt when used within its limitations, but would have
preferred 200 instead of 100 channels.

Oh Great monitoring enthusiusts,

I have noticed a lot of postings regarding the R1 in a somewhat less than favorable light. I would NEVER trade my R1 for any other radio!

I would like to make one very important observation. Due to my LARGE scanner appetite, I have been exposed to more than one scanner of the same model. This includes the R1, Pro 43 and others. I have noticed that the R1 AND the Pro 43 DIFFER in their quality from unit to unit.
The Pro 43 has in my experience, the GREATEST varience.

I'm looking for a fellow named David Wills. He's interested in scanning and possibly ham radio. He doesn't owe me money or anything: he actually does a radio show that I really like. I'd just like to know his whereabouts (I think he lives in the Berkeley area) or if he's got an Email account.

Thanks.

>have to have it serviced.

Althought I doubt this is similar to your problem, I did have a similar problem. When I was installing some "mods" to my 2006, I was drilling holes in the back of the unit. I didn't take the advice to add tape to the drill bit to prevent it from entering too far into the unit once the hole was drilled. I plowed right into the circuit board busting up a few parts. One of them was the battery backup diode. It allows the 9vdc backup once the 12v is off. When I replaced the diode I inadvertantly reversed it. I took my 2006 camping with me but noticed I kept loosing all my memories when power was removed. Then, I got a low battery indicator. When I went to replace the battery, it had exploded. That's when a little investigation revealed that since the diode was reversed, I was *charging* my alkaline :-) while 12vdc was applied and had no power when 12vdc was removed. Eventually, my alkaline leaked while I was charging it :-) giving me the low battery indication.

David

Source record: 271210

Wonderful people at HUP, my gf recovered from a coma there for over
a year.. nice to hear from you.

155.385 will give you all Pennstar comms from dispatch until it lands
on your roof (you are a level 1 trauma center), including patches for
when it goes to a non-standard location. 155.220 will give you Medevac
inflights going to Hahnemann and Camden as well. Unfortunately, you
also hear *very* boring hospital stuff on 155.220 as well. Stick with
Pennstar.

155.235 and 154.145 are the fire dispatch freqs and the police freqs
reside between 453.05 and 453.95.. you can do a range search between
those limits to find the exact channels. 453.15 is the City Hall area
and 453.55 is the "M Mary" channel reserved for big time emergencies or
when the officers select the wrong channel in their cars. You'll usually
hear a high speed chase or shooting within a few minutes of tuning in
453.3 or 453.35 at night. Especially in districts two-five or eighteen.

I used to keep a large map of Philly when I lived there and put a blue
pushpin for a police incident and a red one for a fire/rescue incident.
That got depressing real quick.

I use the radio as a tool while driving in bad weather. In the worst case,
I had to change my route four times in one night because of road-closing
accidents (last Christmas Eve when we had the really bad ice storms).

I've had undesirables steer clear of me because of the radio, and I've
had drunks threaten to pound me on South Street, being a "dumb pig". It's
also fun(?) to know where a cop is racing to when s/he speeds by you
with full sirens and light show, or how far away they are if YOU called
and need help of some sort.

Useful? Eh.. I'd say it's a tossup. Addicting? In a New York second.

Especially once you punch in the Pennstar freq.

Try looking up WNUF-275 callsign......For the VHF band the fcc has authorized
unlimited BUSINESS ONLY to all business frequencies for the purpose of
radio demonstration and/or signal propagation.

On the FCC licence no exact frequency is states just the following.....

25.00000-50.00000 MO 20KOF3E 30 WATTS

150.00000-174.00000 MO 20KOF3E 30 WATTS

450.00000-470.00000 MO 20KOF3E 30 WATTS

806.00000-821.00000 MO 20KOF3E 30 WATTS

.........All within a sixty mile radius of the licensee

And to get on of these baby's , you don't need to go through NABER coordinating
just fill out a 574 and zip it directly with $35.00 to the FCC.

For those people who like collecting commercial radios etc, it's a nice
wall piece.

Hello. I just purchased my first scanner this past weekend (a Radio Shack PRO-43) and am having quite a bit of fun exploring the 'airwaves' with it. One strange thing that I have noticed is that I can hear the audio portion of the broadcast from the local telivision channel 20 at many places over the entire spectrum (all the way from 30 to 999 MHz). In some spots, I pick it up as often as 3 times per 10 MHz frequency increment. Can anyone explain this?

- Dwight Ritums dritums@uh.edu

P.S. I live in Houston, TX.

P.P.S Where would I find lists of police frequencies for Houston, TX?

>Other than 162.55 mhz for the weather, are the any news or other type of >info or "shows" on the air the a scanner can pick up?

You're not going to pick up "shows" as such on the frequencies which most scanners will receive. However, there are a few places where you might find various types of info.-related transmissions.

If you try the 2 meter amateur band, you will likely hear some ham nets covering different subjects. They're not "shows," but a good deal of info on many different topics is exchanged during the nets, which are usually held weekly. There are a few scanner nets that can probably be heard in the NYC area. I haven't heard the first one of these here on L.I., but if it's still operating, you can likely here it in NYC. The second does cover the NYC area even though it's on L.I., and you might also be able to hear it where you are:

Mon., 8 p.m. NY DX, Scanner & SWL net - 146.880
Tues., 8 p.m. Monitoring L.I.Sounds Scanner net - 146.805

You can frequently pick up traffic info during rush hours by listening to the frequencies the copters use to transmit their reports to their stations. These are found in the 450-51 and 455-56 MHz area (WCBS traffic copter uses 451.0875).

Of course, there are also all the P.D. frequencies (in NYC most are 470-72 and 476-78 MHz.) which not only offer interesting listening, but can also be sources of info. at times.

Some scanners can also pick up TV audio.

>I really NEED a good grounding connection or what? Any help
>would be appreciated.

It really depends on the antenna design. You should ground your radio's chassis for best results. I'd recommend spending a few books on antenna design. Go buy some wire and whatever supports you need, and build something. You will save money in the end (maybe), and learn much that will benefit your enjoyment of the hobby.

I found a lot of great pointers to information here, but little actual information. What little actual information is here, I've discovered was stolen from other books on the subject.

Enough of my rant. Here is my 2 cents worth.

Get a copy of Bill Cheek's "Scanner Modification Handbook", parts 1 and 2. It will be the best $30 - $40 bucks you spend. (Grove has them together at a $29.95 deal, and Taylors Bookstores will order them at $17.95 each.)
Volume 1 - ISBN# 0-939780-11-9
Volume 2 - ISBN# 0-939780-14-3

Buy the books. Bill worked hard for his info, and deserves to get paid for it.

If you don't like Bill for some strange personal reason (he seems like a nice guy), get a copy of the ARRL handbook, or the ARRL antenna handbook. Or find some other excellent book on your own, and tell me about it..... I don't know everything, and love to learn more.

Enough of my rant. Here's a good antenna design I promised.

Take a standard 300-to-75 ohm Balun (The one on the back of your TV that converts 75 ohm coax to 300 ohm flatlead). Take some wire (14 to 20 guage, solid if possible).

Cut one wire 18 inches long. Cut the other wire 48 inches long. Solder one end of each wire to a lead on the flatlead from the balun. Hang straight up and down on a wall, and thumbtack it up. Screw a short piece of TV coax on the other end of the balun, and use the correct adapter to connect to your radio.

The offset feed-point in the dipole is what makes it wide-band. This is basically the same design as the Grove "Omni" antenna. (At least from the picture I saw of an "Omni", haven't seen one in real life.) Different lengths will give different results. Equal or nearly equal lengths will make the antenna more narrow-banded.

Ok, before people start jumping on me, it's a 75 ohm impedance, not the "correct" 50 ohm. I'm using about 4 feet of feed line, and it doesn't seem to matter at all to *my* radio. Also, I'm using 16 guage speaker wire, and I left the plastic on. It's stranded, so it should perform worse than the same guage solid wire.

To sum it up, the above described antenna works better than my $25 radio shack ground plane. MUCH better. The ground plane antenna doesn't pick up squat below 100 Mhz. The offset dipole picks up CB (27Mhz) loud and clear. It has better S/N ratio at 900 Mhz than the ground plane. (my ears being the S/N ratio meter) They seem about equal in the 400 - 500 Mhz range. The good point is that it's small and fits nicely in my one-bedroom apartment. It is cheap enough to allow *LOTS* of experimentation with different length ends. (I built mine for free from junk in my closet.)

As I said before, like everything else I seen here, this is information stolen from another source. Bill Cheek's book in particular. I don't think he has a patent on offset dipoles, so I have shared it with you. Enjoy and good health. If you find another cool antenna design, please tell me about it.

Not public domain, but the U.S. Department of Commerce National Technical Information Service makes the databases of FCC license information available on microfiche, magnetic tape, and diskette. Currently they are not planning on making it available on CD ROM.

I understand that there are also services that make these databases available for search and retreival, but don't have a source on those yet.

Ihave bought my PRO2026 about amounth ago and I do not have very much trouble
You may have bought the earlier model, which power cord has permanently
attached to the radio, I have heaerd those earlier radio had some problems.

This is the result of a compromise in the design of the triple-conversion receiver. The (strong) ch-20 TV signal reaches the 2nd mixer through the case. The result is an image that repeats every 3.2 MHz across the spectrum, with the main effect in the upper frequencies. You could try shielding the case.

It'll work fine. You will probably notice stronger signals on the VHF-lo band (30-200 mhz).

If you're trying to pick up transmitters less than 10 miles away you probably won't notice any difference between it and the rubber duckie. If you want to get stuff further away and don't frequent parking garages it might be the way to go.

>
>- Dwight Ritums dritums@uh.edu

This is commonly known as intermodulation (intermod). You must be close
to an antenna transmitting on channel 20 (how does ch. 20 come in on your
TV?) The signal is combining and 'beating' against the intermediate
frequency (IF) in your radio to produce an artifact that breaks the squelch.
Usually intermod is somewhat distorted, but it is usually understandable
if listened to carefully.

Intermod can sometimes fall on or near a frequency you want to hear.
The common solution to this problem is to attenuate the incoming
signal. This can be done by installing an inline attenuator or using
a different antenna (one resonating in a different band than the offending
signal). If the intermod is just strong enough to break squelch the
inline attenuator will soften it enough to allow you to scan the frequency
in the normal way, provided the signal you want to listen to is strong. If
the signal is weak the second solution is the way to go.

6992. Any Motorola HT Mods ?

6994. PRO-2026 LOST FREQS

Newsgroup: rec.radio.scanner
Date: 1994-07-28 06:50:14 UTC
From: jeff.wright@chrysalis.org
Message-ID: <9407280650.09LSN00@chrysalis.org>
Source record: 271201

Greetings:

I got up this morning, went to my truck and turned on the 2026, and it had lost all of its stored channels. This seemed really weird since the thing worked last night on the way home from work.

Anyone else had this happen to them? Anyone know what Radio Shack's repair/replace policy is?

Jeff.Wright@chrysalis.org

>performance specs. Price listed as 449 pounds (oof), but if this thing
>performs like it looks :^) I HAVE TO GET ONE!

The specs sound impressive, except for ...

1. Power consumptions. I can't remember the precise number but it needs
about 150mA while scanning. Wonder how long those NiCads will last.

2. SSB filter. I have a Yupiteru 7100 which comes with an SSB filter
about 2.5kHz wide and i often wish i had a narrow one. Now the
AR-8000 is said to have a 4kHz(!) wide IF filter. This will be great
if you want to listen to more than one station at a time :-)

Wait and see ...

Actually, the ch-20 problem in the PRO-43 is an image created at the 2nd mixer, not intermod. Since the offending signal arrives through the case, attenuating the signal from the antenna would just make the problem worse.

>>Actually, I wasn't looking for as much incriminating evidence as just
>>good stories. Changing the names to protect the innocent ought to be OK,

Ok, I'll kick this off with a story... Heard a local police precinct dis-
patch a car due to a complaint of "suspicious van and occupants across
the street from complaintants house". The van has was reported to have
been there all day. This was followed shortly with an urgent order from
another unit to "stay away from the reported van, it is there on stake
out detail". This was repeated several times, each time with a little
more panic. Shortly, an extremely irate precinct commander called for an
immediate meeting, around the corner, with the stake out leader. Both
were adamant in not complying with the others request. It just sort of
ended at that point, obviously to be continued off the airways. You
usually don't hear this kind of bickering on the air.

7000. Re: pro-51 Mod Needed!

Newsgroup: rec.radio.scanner
Date: 1994-07-28 13:14:54 UTC
From: 10-89 <soren_ragsdale@path1a.med.upenn.edu>
Message-ID: <318b0e$5ih@netnews.upenn.edu>
Source record: 271200

In article <316roo$fb9@netnews.upenn.edu> Soren Ragsdale,
soren_ragsdale@path1a.med.upenn.edu writes:
>When I buy a pro-51 this Friday, I'd like to know how to modify it for
>cellular so I can check the unit in the store.

I got the mod fine. Haven't checked it out, but someone with a 51 says
that it works. Here's what I got, for the beneefit of those that haven't
hacked my mail :)

=-=

There is an interesting test mode in the PRO-51 that, combined with the
direct
search feature of the scanner, lets you pick up out-of-band frequencies.
You
will have full access to the 66-88 Mhz ranges as well as the cellular base
range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these
comments
should be true for any Uniden-made Radio Shack scanner, such as the
PRO-46).
I'll describe them first and then how to take advantage of one of them to
get
the restricted frequencies.

There are three data test modes. These modes completely destroy any
frequencies
you had programmed into your scanner, so it's best to use these techniques
before you program your scanner. If you have already programmed it,
you'll have
to decide if these new capabilities are worth reprogramming.

Test mode 0. Clear the scanner.
A well-known method of clearing the scanner to all zeros is to hold down
the 2
key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900

4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these
in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnostic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is
turned on in a scan from the left side of the display to the right. To keep
this test mode continuous, release the buttons before the first scan finishes.
This mode does not affect stored memory. Press any key to exit this display
mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work on the
PRO-46 or any other Uniden-made Radio Shack scanner.

The test modes I've described as modes 0 and 1 (clearing all channels and
plugging in test freqs in the first 20 channels) have been around since the
BC200XLT (I think also the BC100XLT). They also appear in the BC2500XLT,
although I couldn't find any other test modes in that scanner. The BC220XLT
allows you to do a display element test mode, but, unlike Jeff, I haven't
confirmed any other modes as I don't want to wipe out all my channels. I expect
that Uniden-made Radio Shack scanners will have at least these two modes and
may have the other modes as well. I'm hoping a PRO-46 owner will test this for
us.

I wish I could take the credit for coming up with this trick, although it's
ironic that I had all of the relevant info in my head...I just didn't put it
together.

The basis for this trick came from Glenn Cohen of Scanners Unlimited who was
told this by someone who walked into his store. Glenn confirmed it with Larry
Van Horn at Monitoring Times. I independently discovered modes 3 and 4, which,
to my knowledge, have never been published before.

I did find the display test mode works on the BC220XLT but didn't want to lose
all my memories to try the others. Thanks for biting the bullet and seeing what
happens on yours! Of course, without the RS direct search feature, the test
freqs in the Uniden-label scanners don't do much good.

Restrictions apply only to FCC type accepted receivers. Too many folks
are missing this point. Kits are not FCC type accepted.

Crossing property lines is one thing, what about entering your household?
It's this blind 'it doesn't affect me' attitude that is leading to the
restriction (loss) of individual rights. This cellular law is a precedent
in this country, never have we had any 'receiving' restrictions. This
law is contradictory to a 'true' democratic society.

If an individual is receiving a subscription broadcast w/out paying for
it that's a crime. Cellular calls are comm-links and interception does
not cause lost revenue. If privacy is an issue the technology for encryption
has been available from the start. Now that encryption will be incorporated
in future cellular carriers, the government will have the technology and
the right to intercept your cell-calls. How do you feel about that? What
will YOU do to stop it?

Pardon my cynicism. I worked as a consultant in the comm-interception
business and the bulk of my work was in receivers that had to perform
exceptionally in the cell-ranges. The majority of you folks who are not
regularly involved in this business will undoubtedly have different views.
I consider myself a moral citizen and have a hard time tolerating
the dual standard of 'do as I say and not as I do'.

I don't advocate cell-monitoring as a sole use of a scanner. It's the
continuing systematic loss of receiving liberties that is of concern...

Andy

7003. Re: Best Scanner Stories

Newsgroup: rec.radio.scanner
Date: 1994-07-28 14:07:28 UTC
From: domonkos@access.digex.net
Message-ID: <73xDkiubGAGF066yn@access.digex.net>
Source record: 271216

Last night scanner excitement in the nighborhood hit an all time high.

Harford County , Maryland, was put on a tornado warning at 9:00PM. I heard this on the scanner and the local network TV station. At the moment of the alert the local county emergency dispatchers called all volunteers and regulars to their respective stations. My wife and I put some emergency supplies in a box (including scanner, and 2 Meter amateur handheld) and sat listening to the scanner.

By 9:30PM the surrounding towns had calls coming in on tornadoes ripping through neighborhoods. We noted the path of the storm was heading in our direction. By 9:45 the local fire/emergency dispatchers were sending mobile units to locations w/in a mile of our home. At that point the winds kicked up and we heard what we thought was a large jet passing overhead. My wife picked up our infant daughter and I grabbed our emergency supplies and two dogs and went to the basement. In between all the crashing of limbs and debris against the house we heard calls on the scanner of trees falling on houses within a block of our home. My wife had never before paid such close attention to the scanner traffic and this probably upset her more, especially since we were hearing our neighbors home addresses called out on the scanner for asking for assistance. I felt more relaxed (as relaxed as I could get, the adrenelin was pumping...) and was very impressed w/the swift responses of the emergency teams. Trees had crashed into homes, roads were flooded and drivers were stranded in their vehicles. The fire/emergency dispatches had been so well organized that it sounded more like a well orchestrated symphony. There was a minimum of confusion, I was picking up all the rescue units, even their hand-helds since they were in my neighborhood.

By 10:30PM the tornado warnings and storms had passed. We left the basement and went outside where the neighborhood was alive w/residents and rescue personnel. Large trees were down, some on houses, some in yards (I was one of the lucky ones). The path of whatever had ripped through the community was visible by daybreak. We all were very fortunate that only the dividing tree line between the back yard boundaries were affected (along w/collateral damage from falling trees). The emergency crews had cleared the community access roads by midnite.

I have to add that I was most impressed with the county/state police/fire and rescue squads. They left their families and were out in the peak of the storm responding to emergency calls and on scene w/in minutes. I have never witnessed such selflessness and now have an even greater appreciation for their work.

The weather bureau says we have another potential for serious weather tonight and tomorrow night. I hope not, I've had enough excitement for

a while!

Do you have the old version (20-148) with two wires attached to the back of
the radio or the newer version (20-148A) with a 12V jack on the back (and a
folding stand on the bottom)?

The newer version should hold memory for 14 days according to the manual.

Jeff,

Did you have a drain on the radio's circuit? Maybe the +12 was somehow reversed or shorted after you left your truck. The radio uses a small battery that should keep programming for approx. 14 days.

7009. PRO-51/PRO-23 mods

Newsgroup: rec.radio.scanner
Date: 1994-07-28 15:04:26 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Jul28.100426.2696@hnrc.tufts.edu>
Source record: 271205

Usually, scanner mods can be found at oak.oakland.edu in pub/hamradio/mods/<manufacturer>. This hasn't made it there, yet. I've gotten two requests for it by e-mail so I am postinging it to the group.

This is based on a posting from Mike Schuster that is appended at the end.

1. With radio off, press 2, 9, and LOCKOUT keys. Turn the radio on and release the keys.

2. The frequency 888.960 MHz is now stored in channel 23 of the PRO-51 and channel 15 of the PRO-23.

3. You can now do a direct search in 30 kHz steps and store frequencies in any of the MONITOR slots. To help get a particular frequency into a monitor slot even when the frequency is not in use, turn off the squelch and use the up or down search keys to move one step at a time.

4. Move the frequency from a Monitor slot to a Program channel: enter the channel number, press the Program key, enter the number of the monitor channel, if necessary, and press Enter. (The July issue of MT says to use the Monitor key to get to the desired monitor channel, press the Program key, and then enter the program channel number. No matter, just check the manual for instructions on moving a monitor channel frequency to a program memory frequency.)

Summary: Test Mode Trick

From:76174.637@CompuServe.COM (Howard Bornstein)

There is an interesting test mode in the PRO-51 that, combined with the direct search feature of the scanner, lets you pick up out-of-band frequencies. You will have full access to the 66-88 Mhz ranges as well as the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments should be true for any Uniden-made Radio Shack scanner, such as the PRO-46). I'll describe them first and then how to take advantage of one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies you had programmed into your scanner, so it's best to use these techniques before you program your scanner. If you have already programmed it, you'll have to decide if these new capabilities are worth reprogramming.

Test mode 0. Clear the scanner.
A well-known method of clearing the scanner to all zeros is to hold down the 2 key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00, 109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnostic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide

band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work on the PRO-46 or any other Uniden-made Radio Shack scanner.

The test modes I've described as modes 0 and 1 (clearing all channels and plugging in test freqs in the first 20 channels) have been around since the BC200XLT (I think also the BC100XLT). They also appear in the BC2500XLT, although I couldn't find any other test modes in that scanner. The BC220XLT allows you to do a display element test mode, but, unlike Jeff, I haven't confirmed any other modes as I don't want to wipe out all my channels. I expect that Uniden-made Radio Shack scanners will have at least these two modes and may have the other modes as well. I'm hoping a PRO-46 owner will test this for us.

I wish I could take the credit for coming up with this trick, although it's ironic that I had all of the relevant info in my head...I just didn't put it together.

The basis for this trick came from Glenn Cohen of Scanners Unlimited who was told this by someone who walked into his store. Glenn confirmed it with Larry Van Horn at Monitoring Times. I independently discovered modes 3 and 4, which, to my knowledge, have never been published before.

I've had few out-of-the ordinary problems with my 2 2026's (one new
and one old model) - when used as intended in a vehicle. I live in
rural/suburban New Jersey, and get intermod only on 1 UHF freq.

However, when hooked up as a base unit, with a big antenna on the roof,
the unit is useless.

My $.02 is that this is a good deal when on sale for a vehicular scanner,
but not useful as a base unit.

Listening to the image, as another poster mentions is just as illegal
as listening to the primary frequency. The ECPA makes no distinction
as to how you listen to cellular...it simply says you can't.

As to equipment that can receive via image, there is nothing in the
existing regulations (those that became effective last April 1994)
that addresses images and there is nothing pending. Consider it,
for now, a hole you can drive a truckload of double conversion
scanners through :-)

While the following can be debated, here's my perspective.

As pointed out below, the FCC "exemption" specifically mentions
transceivers, BUT it never defines exactly what a transceiver
is for purposes of the FCC exemption. The FCC position clearly
did NOT specifically require that the transciever be a commercial
product (i.e. having type approval), so the issue can still be
raised as to using any transmitting equipment with an adjunct
scanner...i.e. why wouldn't the combined equipment constitute
a transciever? The real issue will only come up if someone
has such a configuration and is still charged under an existing
state or local "mobile scanner ban".

Date="09/16/93" : Citation="58 FR 48459" :
[PR Docket No. 91-36; FCC 93-410]

Federal Preemption of State and Local Laws Concerning Amateur
Operator Use of Transceivers Capable of Reception Beyond the
^^^^^^^^^^^^
Amateur Service Frequency Allocations

AGENCY: Federal Communications Commission.

ACTION: Declaratory ruling.

SUMMARY: The Commission has adopted a declaratory ruling that
states that certain local and state laws are preempted by federal
law where such laws prohibit the mere possession of certain
amateur service transceivers that are capable of receiving frequencies
^^^^^^^ ^^^^^^^ ^^^^^^^^^^^^
assigned by the Commission for, among other things, police use.

[Bandwidth deleted from previous post...]

>Essientially what the FCC said was that the states didn't have the right to
>restrict the legal use of equipment approved by them, and used in the
>legitimate pursuit of individuals licensed by the federal government.

Agreed except as noted that the FCC did not address what is a transcever,
they set out to provide a premption which does not specify commercial
and/or type accepted equipment as being an absolute.

7013. Re: Rat Shack Freq Counter to find Tx Freq?

Newsgroup: rec.radio.scanner
Date: 1994-07-28 17:21:30 UTC
From: mike@garfield.csuohio.edu
Message-ID: <1994Jul28.172130.1972@news.csuohio.edu>
Source record: 271212

I got enough responses wanting the hold-button mod I figured
I'd post it. Hope it helps one and all!

How to add a hold function to the Radio Shack RF Frequency Counter:

Ground TP 17. In the schematic, TP17 is pin one of U3, connected to
+5V thru a 47k resistor. On the circuit board, TP17 is on the display
side, just right of the lower-right corner of the IC. Grounds are about
1/4 inch below and to the right, the three non-tinned points in the large
area of metal. TP17 is the tinned pad next to a SM resistor marked '473'
for 47k.

I rigged a momentary switch to ground TP17 thru a 1k resistor (you never
can tell) and it works just fine! I drilled a small hole to mount the switch
just above the plastic depression so I could push the button with my right
thumb. A small toggle switch would fit if you want to hold longer.

Galen, KF0YJ

As you can see, I picked if off the net from someone else.

My only other advice is to watch out when you drill the hole
in the metal case for whatever button you want to install.
DO NOT drill with the unit still assembled, you will drill
right into the guts of the unit (NO, I did not do this, but
just make sure you separate the metal half-shell from the rest
of the unit for purposes of drilling).

Mike

| it looking ugly), so I was thinking about mounting it in the attic.

| The roof currently has two layers of shingles on it, so there are
| a lot of nails in the roof. Will this have any effect on the
| performance of the antenna?

| Thanks for your input.

The greatest problem you should experience would be from water on the
roof in HEAVY rain. This may be minimal. I noticed a great improvement
in reception after moving my ant's from the attic to the top of the roof.
This MAY not be a good idea if you get overloaded, which I sometimes do. ;-)

>they just work fine and everyone is too happy to talk about it?

>I'm about to get one if no one says not to- any suggestions of dealers
>with a good price on this?

There was some discussion, and most of us who bought are still
rooting around in the software.

Marymac has them for $280, and 2006's for $345, both including shipping.
That's where I bought mine. Aside from having the 456 installed wrong,
and the software manual only covering about 1/3 of what the software
does, I'm completely happy with it.

Some comments:

The install procedure is detailed and works fine except for the
mini-hook grabbers that are supposed to be used to make a noninvasive
connection to a test point and an IC pin. These might work in the lab,
but for any practical use, cut them off and solder the wires to the
relevant places.

The software is fairly self-explanatory, which is good because the
manual doesn't tell you how to use it. For instance, it will log
PL tones per channel, with number of hits and number of minutes per
tone, and you can also name the users per PL tone.

If you ask, Opto will send you a detailed interface spec for the
commands that you can send to the board, which are a superset of
the Icom CI-V command language. Otherwise you are limited to the
functions provided by the furnished software.

You can download the current rev of the software from the author's
BBS, which number is in the manual on the disk. You can also get a
demo version (functional for 30 minutes at a time) of the "pro"
version which also reports signal strength and will plot a spectrum
analysis.

: contained a statement that said something to the effect of "If it crosses my
: property, I have the right to intercept it."

: I have a few thoughts regarding this line of thinking:

: 1) As I understand it, property rights extend only to land and the buildings on
: it. They don't extend to the air above it or minerals beneath it, or in
: many places even to rivers flowing through it. Therefore, are radio
: transmissions sent through the air actually crossing individual property?

: 2) By this sort of reasoning, anyone would have a right to tap into any
: phone line that crosses their property.

<<< Activating Turbo Flame Mode >>>

Well, along this *new* line of thinking, I might as well say that I
do have the right to make a short range transmitter that does not
extended beyond my property on ANY frequency of my choosing. Using
this approach, I could make a device and market the device to cause
interference of selected frequency ranges within the boundaries of
my property to essentially BLOCK transmissions passing through it.

Admittedly, if only I were to do this, it would not stop the
transmissions, but if I and my neighbors were all to do this in a
neighborhood, YES, it could stop those pesky unauthorized trespassing
transmissions.

Now, what we could do would be to tell the offending companies, if
they want their transmissions to pass over our properties, they will
need to provide us equipment to monitor them for any illegal
transmissions which may take place. Otherwise, no, they will NOT
pass. Perhaps this is what we should do with the cellular telephone
companies. BLOCK their damn signals and issue a written statement,
oh, I meant contract of terms as to what will be required in order
for them to pass through my airspace unobstructed.

Now about them rights... Try buying property next to city hall, and
start burrowing under it to get them minerals down there. Now tell
me they won't come and stop you!!! Aw, you don't own the mineral
rights, and that's why I am under your building! Yeah, really. Pull
the other leg.

Now about that airspace... Try flying over Disney World or a few other
places, you will find how quickly that "unowned" airspace is... as
soon as you land and get an FAA citation. There aren't any "floating"

signs... But try it and let me know what happens. I KNOW what will happen at Dizney World!

: How are you sure that such a converter is legal for sale. The fact that a
: company is selling it does not necessarily make it legal for sale. It could
: mean that Uncle Sam's attention has not yet turned to that company.

: I think converters should be allowed, but the FCC differs with me on that.
: Here's what they said in April of last year:

: "We recognize that frequency converter designs are typically not very
: sophisticated compared to those of scanning receivers, and that banning
: frequency converters capable of converting cellular transmissions will
: significantly increase the design complexity necessary for converters to comply
: with our technical standards. We further recognize, as several commenters note,
: that there are very legitimate uses for converters that convert 800 MHz and 900
: MHz signals down to lower frequencies. Even though the restrictions we proposed
: for converters will undoubtedly make it more difficult and expensive to
: purchase 800 MHz and 900 MHz converters for legitimate purposes, we believe the
: intent of the TDDRA leaves us no choice but to adopt them."

I will state again ... (oh how I get tired of this...)

<<< STARTING TURBO FLAME MODE >>>
<<< FLAME THROWERS READY! >>>

They do sell it as assembled OR as a kit. They could stop selling it
assembled IF they were officially told to do so. No argument there. However,
as a converter it does NOT require an FCC approval and since it is also
available in kit form, there is no requirement to include the date of
manufacture on the unit. They could therefore claim these units were all made
before April 26. Even if they were made after, the FCC could not claim this
as there would not be any proof of that.

As a board, parts, plans, and box, with the first three in one package
and the box as another, it does not constitute a manufactured device. Do we
agree? I think we do. The law states manufacture... not intent to build.

It also was not an imported device, do we agree? Again, I think so.

What law are you referring to which prevents the sale of these parts,
board, box, and plans? What they mean in a law and what it says in the
wording was up to the law writers to clearly define. Since they left
this hole open, I doubt a court would find their "none printed"
intentions to have much if any legal standing.

I guess the next thing you will say is it will be illegal to buy certain components in the U.S. which COULD BE USED in making a receiver or scanner. Nazi Germany, U.S. style! Wheeeee! Way to go... Freedom out the door. My copy of Shortwave Magazine will be here today, and later this year I will have a nice AOR 8000 scanner, factory tuned without any non-factory changes. Ie, NOT from EDCO. Full international range. Guess what? I am going overseas for this purchase... Can't get what I need in the GREAT FREE US of A!

It wasn't I, but I would restate it as "If it passes uninvited
through my body, I have the right to do with it what I please."
It makes the issues much less ambiguous.

For example, I wouldn't fiddle with phones (wired or cellular) because it
involves sending something from *me to them*. I wouldn't get an illegal cable
descrambler because I've invited the signal into my house.

I do not have a satellite dish. If I did, I believe my attitude would be
"If you don't want me descramlbing your signal, don't send it through me."
But, not owning a dish, I admit I haven't thought the issue through
completely. Others' thoughts would be appreciated.

** FBI COVER-UP OF FOSTER MURDER ? ***

There was a big deal made of a Pager found at the Ft. Marcy Park body dump-site in the Senate hearings this afternoon and almost an hour was spent discussing possible numbers on the pager found near the body of Vincent Foster Jr. (murdered WH Council).

Around 13:40 EST on CNN Senator John Kerry (D - Mass.) made a big deal of waving the Pager around while asking/telling the FBI Special Agent that there would be no numbers if the Pager was turned off and the Pager had been found turned off.

It was very clear that the 2 Special Agents were reluctant to say very much but it is also apparent that these 2 must be two of the stupidest investigators in Washington if what they said was true.

I know they couldn't have been that dumb, hence it is clear that the Senate was misled and testimony may be perjured from this pair.

A pager has little to do with the numbers being recoverable. The calls to the Pager would have been logged by the Paging Company that issued the Pager and their logs would have a record of all the calls to the Pager and the numbers left for callback, or full alphanumeric messages if the Pager was so capable.

In any case, it would have been, and would be, a matter of calling the Company that issued the Pager and having them retrieve the logs of pages to that pager. That would have been standard procedure in any serious investigation. Perhaps the Pager was dropped by one of the killers ?

It seems obvious the testimony is replete with ommision and co-mission.

EMF rights to a given property are not covered by law - AFAIK. It used to
be that the [US] radio spectrum was considered **public**, that is, before
the Cellular industry bought portions of it from our CONgress. No other
country _prohibits_ it's citizens from listening to non-military
communications - again, AFAIK.

>2) By this sort of reasoning, anyone would have a right to tap into any

You're missing the point! If folks want to use the (sort of) public
airwaves to communicate, fine, but you and I, and that lady over there and
that guy in Idaho on the Mac own them and I (at least) reserve the right
to listen to them. Now if they want to encrypt them, great, more power to
'em.

Lee
There is another alternative. Grove sells an antenna coupler (splitter) for $15 that you connect to your existing car antenna cable, that allows you to use both the car radio and your scanner at the same time, with no holes to be drilled. I put one on my Mitsu 3000GT because no magnet mount will hold an antenna on the car at speed. UHH, Just in case I should ever need to, yeah thats it, just in case because 65MPH MAX is the law, right. It works pretty well, and I don't have to worry about putting another antenna on my car, so it's perfect for my needs (the need for speed).

Good scannin' to ya.

7031. Wire antenna on 46 mhz?

Newsgroup: rec.radio.scanner
Date: 1994-07-29 21:02:12 UTC
From: kcliao@UCI.EDU
Message-ID: <Pine.3.89.9407291319.A16838-0100000@e4e.oac.uci.edu>
Source record: 271110

I came across some messages on the forum regarding the usage of wire antenna attached to the existing scanner telescope antenna to pick up 46 mhz signal and worked well....I would like to know more about this set up as far as exactly what type of "wire"is used and the way to install.

I am now using a R.S. indoor TV antenna for my scanner and it seems work better than the telescope one. I would like to enhance this combination.

Any comments is appreciated.

bad choicxe of an example. This has already been done and the government
did nothing to ban scanners. They have banned their use for cellular
private communications and the like, but they will never be banned
completely.

Why? It has been stated that the police, fire, etc etc should not be
hiding from the public. Since they are to serve us it is believed that
the public should have the write to hear what goes on and where our tax
paying dollars go.
So only a few channels are allowed to be scambled or private, and
those-I am told- require permits and paperwork to be written out in order
for a particular law enforcement agency or group to use them. And there
are other restrictions ...

)could get really busted for it, so I choose 1. (Hence my hypothetical
)scanning of the cellular band.) Then again, I'm very new to this and
)perhaps I haven't taken everything into consideration. What would you do?

I have faced this exact circumstance recently. I overheard a woman
talking with a girlfriend about a car theft she had planned with another
man. The idea was to really steal the stereo system in the car, but it
was a large and complex installation, and they didn't want to damage the
equipment. So they decided to steal the car, and move it to where they
could remove the stereo system at their liesure, then dump the car.

I opted for (1) - do nothing. Incidentally, further monitoring resulted
in no further conversations regarding this, which I take to mean that
the theft did not occur.

I think option (3) would be very foolish.

Just a chicken at heart, I guess.

Mike

The original PRO-43 has been replaced with an unmodifiable version. The original had an FCC ID of AA020-300 (found on the name plate). The new version has an "A" suffix, i.e. AA020-300A.

Some of the old version are still in store inventory, so check the name plate on the back (or purchase the display model, which is probably an old one).

/* barry /&

P.S. Note that the key is the _suffix_. The "AA0" prefix denotes "A & A Trading", Radio Shack's importer.

7040. decoding POCSAG on the MT-400

Newsgroup: rec.radio.scanner
Date: 1994-07-30 01:21:24 UTC
From: milcom@netcom.com
Message-ID: <milcomCtqBro.Dvx@netcom.com>
Source record: 271088

We got a MT-400 universal decoder today and it works fine.. However the cap codes (pager address) doesnt decode to the correct number. The displayed number isnt random.
I would like to know if there is a MOD to get the display correct for POCSAG pager addresses. If not, then there must be some math formula to convert it to the correct number.
The MT-400 decodes 512 and 1200 baud pocsag, yet will not automatically switch to the correct baud rate.

Nope. The number given to the pager customer IS different than the
actual CAP code sent. For security reasons, the carrier has a
look-up table converting the number given to you and generating
a look-up entry number programmed in the pager.

While the new M400 has 512 and 1200 (the older M400 handles only 512
bps), Skytel is already at 2400 POCSAG and going to FLEX.

: : Chris, you can sometimes find it in the magazine racks at Barnes & Noble
: : superstores. It's hit-or-miss as the magazine selection is apparently up
: : to the local manager. It's usually next to Monitoring Times and Practical
: : Wireless.

: : I considered subscribing, but apart from the ads there really wasn't THAT
: : much more than the domestic (USA) mags to make it worth the cost for me.

: Just got off the phone with Barnes & Noble Superstore in Tampa, FL.

: They are mailing me (UPS) one of three remaining copies. They take
: charge cards and with the use of the reader's choice card, my total
: was under $8 including shipping.

: Costs are $4.95 for magazine, $3 for shipping, plus applicable taxes.

: Phone number for the two remaining issues (after *mine*) is
: (813) 977-0404. Another superstore in Miami is (305) 598-7292,
: not known if they have any though.

: Good Luck (mine should be here tomorrow ahhhh how nice! I get to
: see this new scanner! I also needed to update my list of non US
: suppliers).

UPDATE:

I do not normally make a follow-up to my own comments. But that copy of
Shortwave Magazine mentioned above is now in my hands... It's well worth
buying a copy -- particularly if you want any model of U.S. scanner with
FULL CELLULAR coverage. The Pro-2006, Pro-43, ComTel 203/204/205, they
are all readily available from a wide choice of dealers. Also do not
forget that while duties will have to be paid, you do not have to pay
VAT taxes (17.5%)!

After looking at the adverts, I can not see how anyone would buy a non-cellular
scanner in the U.S. I mean, why bother! They are braindead. Ordering outside
the U.S. gets you the FULL COVERAGE INTERNATIONAL version as was intended at the
factory. It permits it to be usable world-wide when traveling, etc.

Like I said -- wide choice. With some of these, it is the only marketing in
the U.S. you will see. Well worth the $4.95 (plus $3 shipping & tax) for the

occasional issue to determine equipment sources and costs. I mean with some companies, you pay $10 just for the catalog!

Great magazine... Planning to get an UNCENSORED AOR 8000 later this year. Any word regarding EEB/EDCO as to if (un)common sense has struck them and made them to see the value in selling the parts they are changing to convert the INTERNATIONAL to DOMESTIC LIMITED versions here? The FCC can't regulate those components they are changing. I mean all we want is for the technicians to bag them as they change each unit, right? Perhaps even include them with the scanners for those wishing to mod it back. Ideas?

Okay, campers. I have watched this long enough and said nothing. Here's my pitch.

If anyone is getting radio freqs from the waste of a tree book put out by radio shack, do so no further. That book is a waste of the paper, and is so fouled up with information it isn't funny anymore. Now, I don't know WHO does the research or WHERE they get their info, but it is enough to make one contemplate suicide.

So enough flaming of the Chicken Shack Folks. Here's my alternative. There is a book and disk published that has detailed listings of city, county and state freqs, Inputs and PL tones. I believe it is a GMRS book, but don't quote me on that. Most of the files on the disk aer text files ending with .GRS (Govt radio systems). This book is available at scanner stores and I believe also at ham radio stores. Look around. It might be hard to find, as opposed to Chicken Shack on every corner, but at least the information is much more reliable.

DISCLAIMER for all those PC right wing bastards out there:
This post is from California, and may not apply to your area. But look around, for it may very well exist. I will hunt down more info and post it, but at least it will give you a start on finding a multitude of freqs.

>authorization shall be performed using assembled representative kits."
>
>"The lack of technical regulations for mass-marketed kits has resulted in a
>number of non-authorized devices being offered in kit form," the FCC added.

Then I suggest that this is the most ignored regulation in existence in
the electronics arena as every issue of any electronics hobby magazine
contains multiple "build it yourself" articles and such articles often
contain an offer to provide all the required parts along with a printed
circuit board. I think it's safe to say that none of those "kit packages"
ever went through an FCC part 15 certification.

>> Nor did the FCC ever see fit to specifically ban kits as can be seen in
>> the text of the language that was finally adopted.
>
>It didn't have to specifically ban kits, because the ban applied to the devices
>period: both manufactured and kit versions.

As above, this would sure seem to be an are of regulation that is
wholly ignored today by the FCC.

>Can you imagine them saying, "Oops! We forgot to ban kits! What idiots we are:
>all this trouble to ban frequency converters and scanners and it doesn't matter
>cause they can still sell kits!" Not likely... ;-)

Actually, it wouldn't surprise me to see such a lapse in governmental
oversight.

Bringing up my example above again. Do you claim that a magazine
construction article for a block converter is in any violation of the
ban?

If a supplier offers a package of the component parts specified in the
article, is that in violation if no schematic is included.

Lets face it, there's no way the government can eliminate the construction
of block converters...even if the law said anyone doing so would be in
violation. The "underground" of information sources on construction
would continue and the parts availability simply can't be eliminated
(because the parts for a block converter are generic and used in many
different electronic devices).

As to the Ramsey kit that was mentioned in the original post that started
this discussion...I'd find it difficult to imagine that Ramsey would
risk governemntal prosecution/fines/etc. if they are really violating
current regulation by selling a cellular converter kit. Could the
lawyers for Ramsey be that stupid?

Personally, I could care less about listening to cellular, I just find
the current efforts to "ban listening and equipment" to be both
a waste of timne and totally unenforceable.

Cheers,

7051. Frequency counters

Newsgroup: rec.radio.scanner
Date: 1994-07-30 06:37:07 UTC
From: linley@netcom.com
Message-ID: <linleyCtqqDw.Myu@netcom.com>
Source record: 271092

I'm surprised that frequency counters aren't mentioned more often in this group. Maybe this is due to frequency counters being used only by the hard-core scanner enthusists or more likely, a lot of people just don't know what they are. Even in the Intro to Scanning FAQ, frequency counters are mentioned only in a single sentence ("I've used [...] a frequency counter for close-in work"). In response, I have put together a mini-FAQ for frequency counters.

So what is a frequency counter?

Basically, a frequency counter picks up and displays the frequency of the nearest transmitter (that's transmitting).

But I've got Police Call (or similar). Why do I need a frequency counter?

For one thing, published lists of frequencies sometimes hold out of date information. Frequency assignments are not carved in stone and are constantly changing. Your local police dept listed at 155.445 may have since upgraded to a new UHF system or added new channels and you won't know about them until next year when the next frequency list is published. Also, you may be unable to find the local high school frequency you're looking for because the school is actually transmitting on a local unused police frequency. Worse though, is when you try to look up the frequency of the fire station 3 blocks away only to be befuddled by a list of frequencies for the entire dept. that takes up two pages of fine print. Lastly, many publications do not cover local business frequencies because the list for any wide area publication would be enormous. With a frequency counter you find exactly what you're looking for.

So how do I use it?

For base stations, a frequency counter will usually lock onto the desired frequency anywhere near the transmitting antenna. Sit out in front of the police or fire station and wait for the counter to lock onto a frequency. A hold button is handy when transmissions are too short for you to be able to remember the displayed frequency. For taxicab/bus/shuttle frequencies, just take the frequency counter into the vehicle and wait for the driver to transmit (remember that these frequencies are likely to be the input frequencies). If the desired frequency is someone's walkie-talkie frequency, you may have to get really close to lock onto the frequency, depending on the transmitter's power output and the sensitivity of your frequency counter. If you know the person, you can get them to key up for you (to ask the time or something), and the frequency counter will do the rest. Don't get in the person's way though. And beware at airports. Frequency counters bear an uncanny resemblance to the stereotype remote control bomb detonator.

But frequency counters are really expensive, right?

Not really. They can be had for as little as $99 (at Radio Shack) to a few hundred dollars (for some of the Opto-Electronics models). The price differences reflect the frequency ranges covered, sensitivity and features. For scanner frequency hunting, you'll want a model that covers 30-1000MHz. A hold button is also very handy to freeze the display when transmissions are short.

OK OK. I understand that you don't know me from Adam's house-cat, so I won't take offense to being grouped in with rumour-mongering, Enquirer reading, ignorant people who sometimes pop up here from time to time, (or the fact that you called me Mr.Banks). I am not a professional reporter, nor do I play one on TV, so let me thank you for pointing out that you would appreciate references for my comments, (so to speak).
July, 1993 issue of The World Scanner Report says "It seems that the New Jersey Attorney General office sent a threatening letter to Tandy Corporation charging some obscure violation of law because their cheaper 800-MHz scanners could receive cellular telephone calls by way of tuning to out of band image frequencies! This threatening letter caused Radio Shack to scurry about in terror, pulling ALL their dual-conversion 800-MHz scanners from the store shelves! Now get this: the TRIPLE-conversion PRO-2006 and PRO-43, both of which can tune the CMT bands with a minor modification, are not impacted by the NJ Attorney General's threats! We don't know the gory details of this situation, but it seems they are trying to set a precedent for the outlawing of reception by image frequency interference! ... See "Monitoring Times", July-1993, p6 for the latest on this hokey issue."
Now, happy?

Whoa!!!!

Danger, Will Robinson!

Besides the potential problem of importing a scanner that is not legal
here, you should be aware that cellular channels are not spaced 30 KHz
apart in UK.

So any cellular-capable scanner you buy form there will not land on the
proper frequencies for US cellular channels. If it's something like the
Yupi or AR8000, where you can manually choose the channel increment, that
isn't a problem. But the equivalent of the PRO-43, for instance, could
present major headaches.

I installed the cellular mod in my PRO-43 and now 46mhz range is gone.
The bank still scans these frequencies, but picks up nothing.

All I did was remove D4. I did not reinstall the diode to D3 to extend the
50-80 band.

Do I have to lose 46mhz range to get 800mhz coverage?

You have decided to purchase a frequency counter in the $100 to $200
price range. What should your decision be? The Optoeclectronics
M-1 counter at $229 is the best choice. This is the second counter
that I have owned and I am very happy with its performance. The
first was an Opto 2800 which was fine. I am much happier with the
M-1. It has a digital filter that just works great in removing the
background noise from the counter's display. With the filter on and
the capture function off, the counter shows the last frequency that
it has read. In other words, if a new frequency is picked up it
will show up in the display. This is not perfect as the M-1 has
tried to do more than this (with its 3 memory register),but it's great
considering the price. I don't use the memory function much at all.
There is a new Opto out that automatically logs 250 frequencies, but
it is dear at $399.
The phone number is 800-327-5912
I bought mine for $219 at a Hamfest from Ramsey Electronics.
I am of course suggesting that the extra $29 is well spent and that
to limit yourself to $200 is a bad idea.

I notice some frequencies come in better grounded and some recept
better ungrounded.

For example when my all-band IS grounded 108-140 MHz receive better.
When it IS NOT grounded I get cellular in better.

Any care to try to explain?

Scan Ban Fans,

I'll respond in this message to comments from several of your postings. I hope you don't mind if I don't include the attributions.

I participate in this thread because I learn new things. Especially if someone has evidence that my understanding of the scanner ban is wrong, I'm very interested in that. I'm not interested in winning an argument.

By the way, we should be careful to distinguish between the TDDRA scanner ban passed by Congress and the ban as actually implemented by the FCC in its regulations. They are two different things.

Steven Bradley suggested that the FCC could have told the Congress to go to hell (my paraphrasing). The FCC did do this early on when it stated its opinion of the ECPA. The FCC said that the existing regulations were fine and that ECPA was not needed and could even make it difficult for citizens to report interference (which the ECPA does).

That letter went down like a ton of bricks on Capitol Hill. It became obvious that ECPA's boosters were not going to get cheering support from the FCC. They did not get it from the FBI, originally, either, which is described in the New York Law Review article cited earlier. The FBI eventually turned around when it got its wish list items granted by other parts of the ECPA.

To this day I have never seen the FCC endorse or support the ECPA. It has consistently said only that it is *Congress' position* "that reception of cellular communications by means of scanning receivers is a serious problem that must be resolved expeditiously" (see the Kenwood thread). The FCC is obligated to follow the law, of course.

Let's go to the phones!

>They do sell it as assembled OR as a kit. They could stop selling it
>assembled IF they were officially told to do so. No argument there.
>However, as a converter it does NOT require an FCC approval

The converters we've been talking about are banned. I think the question is whether or not kit versions are banned.

>I guess the next thing you will say is it will be illegal to buy
>certain components in the U.S. which COULD BE USED in making a
>receiver or scanner. Nazi Germany, U.S. style! Wheeeee! Way to go

I do not say that. There is a long history of cases dealing with what is a "subassembly" and what is a package of parts, etc., for purposes of whether that assembly or those parts have to be FCC authorized. The FCC makes a decision about what it has to authorize and what it doesn't. They don't regulate diodes, knobs, power supplies. The cases on kits, on the other hand, are probably slim (see further down).

>A 400-512Mhz scanner does not cover the cellular band. How does a
>converter that converts a range of frequencies not targetted
>particularly for cellular reception fall into a restricted category?

It does because the converter must be incapable of operating, tuning or readily being altered by the user to operate or tune within the cellular bands. All the manufacturer has to show is that the converter or scanner leaves cellular out. If it covers a wide range of frequencies other than cellular (for example the SMR and 800 MHz public safety bands) it still must block cellular.

One of the points we made repeatedly to the Judiciary Committee during the ECPA hearings was that 800 MHz scanners did *not* originate with cellular; that people use them to listen to the new public safety systems just like scanner users have always listened to police and fire. The Congressional staffers thought that was an absolute crock and loudly rejected it on every occasion. PEOPLE BUY THESE SCANNERS TO LISTEN TO CELLULAR, they pounded away, and were told by the cellular lobbyists that 800 MHz coverage occurred only for cellular monitoring.

One Representative went beyond that by criticizing all scanner coverage. He angrily read from ads for scanners that advertised all the different radio services you can hear, including Amateur Radio, as if that was a terrible problem! Scanner users were painted as evil scum.

>Does the law restrict converters made specifically to convert the
>cell-range or the entire spectrum?

If it includes cellular it is banned, whether specifically for cellular or the whole spectrum or parts of it. There must be this hole in the coverage or it can't be sold.

>Last, how does this affect the NSA? Surely they have requirements for
>cell-capable receivers. If so, are they now breaking the law if they
>have access to cell-receivers?

No. 47 CFR 15.121(b) exempts scanners and converters that are manufactured exclusively for, and marketed exclusively to, providers of communication service or government officers or employees at the federal, state or local levels (18 USC 2512 (2)).

>I suggest that this is the most ignored regulation in existence in
>the electronics arena as every issue of any electronics hobby
>magazine contains multiple "build it yourself" articles and such
>articles often contain an offer to provide all the required parts
>along with a printed circuit board. I think it's safe to say that

>none of those "kit packages" ever went through an FCC part 15
>certification.

The suppliers probably don't know that the rules changed, especially since the FCC hasn't made a big deal of it, because they could get into a Pandora's box if it tried to enforce it except for particular egregious cases. Nevertheless it is there.

Kits are not a loophole. The FCC intended to regulate kits in the 87-389 rewrite. But I will follow up on this.

>Do you claim that a magazine construction article for a block
>converter is in any violation of the ban?

It is a ban on hardware, not on articles (First Amendment).

>If a supplier offers a package of the component parts specified in
>the article, is that in violation if no schematic is included.

I think the FCC would have to decide if that was a "kit" or not. See the definition of kits earlier in the thread. If it is a kit, and if kits are banned, then I suppose the package could be banned. A problem in answering is that the FCC regulation of kits is recent and there may be little or no case law on the books about it.

>Lets face it, there's no way the government can eliminate the
>construction of block converters...even if the law said anyone doing
>so would be in violation. The "underground" of information sources on
>construction would continue and the parts availability simply can't
>be eliminated (because the parts for a block converter are generic
>and used in many different electronic devices).

You could say the same thing about, say, CB "afterburners". The FCC loves to seize these. Have they eliminated them from the U.S.? No, and they never will for the reasons you cited.

>As to the Ramsey kit that was mentioned in the original post that
>started this discussion...I'd find it difficult to imagine that
>Ramsey would risk governemntal prosecution/fines/etc. if they are
>really violating current regulation by selling a cellular converter
>kit.

Good question. They are a major kit supplier, but are any of their kits FCC authorized? I think they are a great company, regardless.

>Personally, I could care less about listening to cellular, I just
>find the current efforts to "ban listening and equipment" to be both
>a waste of timne and totally unenforceable.

Those efforts put kids through college. It took a lot of time and energy to get the ECPA passed, and then to make the scanner ban a "rider" on otherwise innocuous legislation (the TDDRA) after failing in efforts to get it passed in other bills.

Bennett

7060. Re: antenna and cable

I run a very informative Scanner, and Shortwave radio hobby
computer system "ShortWave Paradise". We have much up-to-date
frequency information for scanners for cities, counties, +
states all over the United States (so much so, you'll be
suprised!) Many info, and mod files too!
We are online 24 hours a day at (616) 383-4979.
Well worth checking out if you are looking for scanner, +
SW info. (We are even running the "NEW" Wildcat Ver. 4)
Check it out!

We offer a "Free" 15 day trial period too! Please call today!

7062. AR-8000 Reviewed Here!

Newsgroup: rec.radio.scanner
Date: 1994-07-30 17:58:56 UTC
From: scollin@sapphire.win-uk.net
Message-ID: <96@sapphire.win-uk.net>
Source record: 271108

Dear All,

Thanks for your many requests concerning the AR-8000 review. There seems to be a lot of interest in this radio, so a review seems more than worthwhile.

Sorry for the delay since my promise of doing this review. The original AR-8000 I had turned out to be a pre-production prototype so I decided to wait until I could get a full production model before posting.

I have tried to find an answer to all your questions, but if there are any other requests please feel free to send them in. I expect to have the production AR-8000 for sometime to come.

-------------------------cut here----------------------------

Review of AOR AR-8000 handheld scanner
======================================

The AR-8000 is a wideband handheld scanner with a published coverage of 500 kHz - 1900 MHz for the UK (it can actually covers down to 100 kHz). Certain bands will be inhibited in other countries so that the radio complies with local regulations.

The full range of modes are provided: AM, NFM, WFM with the addition of USB, LSB and CW. The SSB modes do not rely on a manual BFO but use a dedicated carrier insertion oscillator like a quality shortwave radio. The frequency shown on the display is the true frequency (not offset).

Here is a run down of the specifications:

Frequency range: 500 kHz - 1900 MHz
Modes: AM, NFM, WFM, USB, LSB, CW
Frequency step sizes: 50, 100, 200, 500 Hz, 1, 2, 5
6.25, 9, 10, 12.5, 20, 25, 30
50, 100, 200, 250, 500 kHz or
any multiple of 50 Hz up to
999.995 kHz

Sensitivity:

500 kHz - 2.0 MHz: by field strength at internal ant.
2.0 MHz - 30 MHz: SSB 1.0uV, AM 3.0uV, NFM 1.5uV
30 MHz - 1.3 GHz: SSB 0.25uV, AM 1.0uV, NFM 0.35uV,
WFM 1.0uV
1.0 GHz - 1.3 GHz: NFM 1.0uV

1.3 GHz - 1.9 GHz: NFM 3.0uV

Selectivity:
SSB: 4 kHz (-6dB), 15 kHz (-50dB)
AM/NFM: 12 kHz (-6dB), 25 kHz (-60dB)
WFM: 180 kHz (-6dB), 800 kHz (-50dB)

Antenna impedance: 50 ohms

AF output (at 4.8V): 120mW (8 ohm) THD 10%

Power requirements: 4.6V Nicad
6.0V Manganese battery
Ext 9.0 - 16V

Power Consumption: 160mA (nominal)
110mA (standby)
20mA (power save)

Memory channels: 50 channels x 20 banks = 1000 total
Pass channels: 50 channels x 20 banks = 1000 total
Priority channel: 1

Scan/search rate: Approx. 30 channels per sec

Appearance and general use

The AR-8000 is neat and stylish in appearance and is distingushed from most other radios by the four row LCD alphanumeric display (more on this in the section below and throughout).

There are three rotary controls on the top of the radio: power/vol, squelch and tuning. The tuning knob is a click-stop type which duplicates the up/dn push buttons on the front panel when tuning. I liked the tuning knob because you can hold the radio in one hand and easily step up/dn the bands using the other.

Four sealed in push buttons are provided down the left side of the case. These allow the LCD back-light to be selected, secondary functions to be selected from front panel keys, the keypad to be locked, and (best feature) the squelch to be defeated so that it is forced open when a weak signal has been found.

The keypad itself comprises 20 rubber-like keys which have a positive feel.

You can power the set using internal batteries (nicads if preferred) or an external 12v dc supply.

A rubber duck antenna is provided and plugs into a high quality BNC connector. There is a 3.5mm "ear" socket next to the antenna BNC.

Selecting frequencies and modes is straight forward. You just type in the frequency and press ENT to change frequency. The mode is selected

using the 2nd function key and '7', then the up/dn keys or the rotary knob on the top of the radio.

The minimum tuning step size is 50 Hz.

One nice feature is the auto mode where you can make the radio select the appropriate mode for the band you are on automatically. This can be turned off if required.

When you first start using the radio, it operates in "new user" mode and some of the advanced functions are disabled. However, once you have got the hang of using the radio, you can select "expert user" mode and adjust some of the more complex parameters of the radio. Throughout this review I refer to "expert menus", these are only displayed when the radio is in expert mode.

The radio has a power save facility which lets you run the radio for long periods of time using the batteries as efficiently as possible. When the power save feature is ON, the radio switches OFF then ON periodically to save power. Only the RF circuitry is powered OFF, the CPU and display remain ON. The expert mode lets you alter the delay time (the period of time before the radio switches off after a signal has gone) and the cycle time (the period of time the radio is toggles OFF then ON while there is not signal).

The expert mode also lets you alter factory presets such as the lock detect time (VCO and PLL stablisation time), squelch detect time, the audio squelch detect time and the audio level required to open the audio squelch.

Alphanumeric display

The alphanumeric display has a variety of functions and becomes the main focus for your attention when operating the radio. The display is a dot-matrix type and has wide viewing angle which is at its optimum when the radio is held in the hand during normal operation.

There are two VFOs, both of which are displayed together with the mode and s-meter level. You can swap between VFOs with a push of a button. I particularly liked this feature - long overdue in any scanner.

At least 14 different menus or displays can be shown. At times, the display operates like a small vdu giving you a menu type display. At other times it is a comprehensive status display.

There is an 11 element panoramic (or spectrum) display on the third line) that shows you activity on adjacent channels. This proved to be an effective way of finding active channels nearby.

Memories

One thousand memory channels are provided in 20 banks of 50 channels. The banks are designated "A" thru "J" and "a" thru "j". The lower case memory banks can be password protected. Each memory channel has an address like "A00" or "J23" or "b34".

When you store a frequency in a memory channel you can add a 7 character comment. The comment helps with identifying channels held in memory and is very useful. The process of adding a text comment is easy: you just use the tuning knob on the top of the radio to select a character and the step keys to move the cursor backwards and forwards on the alphanumeric display.

There are a variety of memory editing factilties including copying a channel, moving a channel, swapping channels and deleting channels or banks. A system of menus is used on the alphanumeric display to help you through the steps required.

The password protection involves you entering a 4-digit number rather like the PIN number used with a bank ATM card. You enter the password whenever you want to access protected functions. Operation with the password is optional.

RF and scanning performance

Several IF filters have been provided (see specification above).

AM bandwidth is a bit wide for HF use but after an evening's listening on shortwave, I found the performance was quite impressive. This radio is best suited to listening to major broadcasters and has similar shortwave performance to a Sony SW-7600 or an AR-3000A (I have both radios available here). Performance can be improved by replacing the "rubber duck" antenna with a larger antenna tuned for HF reception and using the attenuator (if necessary) to prevent overload.

I talked to AOR (UK) about the choice of filters in the radio and was told that the radio was optimised for VHF use. Filters that are too narrow can cause signals to be missed if they are slightly off-tune. This seemed sensible to me since I have this problem with my Icom R-7100 which misses certain airband signals which are slightly off channel.

Most controversial is the choice of 4 kHz filter rather than the 2.4 kHz originally planned. I was told by AOR (UK) that the filters are standard parts and that different filters can be substituted with the minimum of effort. It should be possible to change the filter to whatever bandwidth you want.

Bearing in mind the filter, SSB performance is still quite good on HF allowing HF amateur radio and utility signals to be received clearly. Frequency stability is excellent through the use of true SSB.

The scanning speed is one of the most impressive features of this radio. Memory channel scans and search scans operate at 30 channels

per second.

There are very few spurious signals from within the radio and strong signal handling is very good. I live 2 miles from a 1 kW FM broadcaster and amongst several strong radio pager signals. I did not get any breakthrough from these signals on nearby bands, even when tuned to the nearby VHF weather satellite band.

The scanning facilities offered from the keypad is extensive and the speed of scanning VERY impressive. It is possible to alter the timings used and the behavior of the radio when new signals are found. By default (from the factory) the radio stops on active channels and dwells for 2 seconds before resuming the scan, but you can alter it in the range 0 - 9 seconds.

The expert menu lets you change 5 scan parameters in all: scan delay before resuming; audio squelch detection (ON/OFF); dwell time on active channels; the S-meter level required to stop scanning; all modes or just the selected mode to be allowed.

Up to 100 memory channels can be "tagged" so that only the most interesting are included in the scan. Memory banks can be "linked" in or out so that the selection of memory channels to be included in scans is very flexible (you can select both individual channels and banks).

One thousand pass channels are provided so that you can exclude channels from scans if you want. The radio will prevent you from entering the same frequency twice by checking to see if the new frequency is within +/-10 kHz of any others already "passed".

A single priority channel (memory channel A00) is provided.

A total of 20 search banks allow you to enter two frequency limits, mode, step size and a 7-character comment. The search banks are designated in the same way as the memory banks: "A" thru "J" and "a" thru "j". The lower case search banks can be password protected.

You can link search banks together (so you could have A, C, H, c, e, i for example).

Once again the expert menu allows you to alter the parameters of the search. You can alter four parameters (in fact equivalents of the first four scan parameters, you don't need to select the mode).

Here is something exciting!!!, the auto store search mode. Auto store operates during a scan and automatically copies the first 50 memory channels that are active into bank "J". This is particularly useful for finding active channels while the radio is left unattended.

RS-232 computer control

The AR-8000 marks itself out yet again through the provision of RS-232 control. I think this must be unique for a handheld. Not only does this radio have RS-232, it has the most extensive range of commands I have seen. It exceeds those offered on the ICOM R-7100 by a long way.

In addition to the normal range of tuning and S-meter commands, a range of frequency scanning, memory scanning and pass frequency commands are provided. This means you can have computer controlled scans at the full speed of the radio.

There are about 40 different RS-232 commands relating to scanning operations. You can control frequency ranges, memory channels, the squelch level and mode, delay and free times. This is unheard of in most radios let alone a handheld - very impressive.

You need a CU-8232 interface unit to connect your computer to the AR-8000. A short ribbon cable is inserted into a slot in the battery compartment and connects the radio to the interface. You then connect your computer through a two-wire link to the 9 way D-type connector on the CU-8232. The interface unit is powered from the radio.

You can also use the interface unit to copy memory data from one radio into another. This is yet another unique feature.

Summary

You only have to look at the range of facilities I have described to see that this radio is a real winner. Time and time again, new and genuinely useful features have been provided. This radio is unique and is hard to beat for value.

Don't take my word for it though - go and see the radio for yourself at a dealer.

Notable features:

Excellent manual written directly in English (not translated).
Range of RS-232 control commands (the best available I have seen).
Alphanumeric display giving clear easy to read information.
Panoramic (or spectrum) display.
Dual VFOs
Password protecting memory channels.
New user and expert modes of operation.
Copying memory data between radios.
Inbuilt ferrite rod antenna for MF coverage

The AOR AR-8000 retails for 449 pounds in the UK and is available from AOR (UK) Ltd., Adam Bede High Tech Centre, Derby Road, Wirksworth, Derbyshire DE4 4BG ENGLAND Tel: 0629 825926, Fax: 0629 825927.

In a previous article, kcliao@UCI.EDU (Kuo Chin LIAO) says:

>I came across some messages on the forum regarding the usage of wire
>antenna attached to the existing scanner telescope antenna to pick up 46
>mhz signal and worked well....I would like to know more about this set up
>as far as exactly what type of "wire"is used and the way to install.
>
>I am now using a R.S. indoor TV antenna for my scanner and it seems work
>better than the telescope one. I would like to enhance this combination.
>
>Any comments is appreciated.
>
>KC Liao
>

I've seen several wire dipole antennae sold for 46-49 Mhz band. They have a BNC connector on the lead and I would quess some sort of balun matching device to impedence match the dipole to the 52 ohm input of the scanner. You can get a copy of the ARRL Antenna HandBook and build your own.. A ham radio store can supply you with the impedence matching balun, these are available with a coax to wire connectors.

There is a modification to delete the keyboard beep:

Remove the cover and locate connector CN3, a 15-pin connector with colored
wires at the front of the main circuit board. There are two procedures which
will stop the beep tone from being heard through the speaker.

1. Find the center gray wire coming from CN3 and cut it midway to disable
the beep tone. You may wishe to solder a resitor in series to reduce the
beep volume, a trimpot to vary the volume of the beep tone, or a mini-
switch to choose between beep or no beep.

2. Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3,
revealing a row of pins. Locate the center pin (#8) which corresponds
to the gray wire and bend it down flat, disabling the beep circuit.
Reinsert the plug. The pin may be erected again later to restore the
beep tone.

According to a SECRET FBI MEMO from the special agent in charge of
the Detroit Office to the Director, I monitored and recorded the
tramissions of the FBI and attempt (I succeeded) to identify the
subject under surveillance.

My active monitoring of them, resulted in threats and harassment by the
FBI... the Justice Department investigated their harassment, and forced
one agent to waived his privacy and and 5th amendment rights and answer
their questions. Of course, all I got from the FBI was a say-nothing
two paragraph response that was prepared by the Special Staff of the
Intelligence Divison. My Congressman, got an additional, SECRET memo
on the matter.

Portions of the highly censored FBI records released under the Freedom
of Information Act, are available through my fax-on-demand service.

I'm new to scanning & looking to buy a handheld for myself.
A store near me has the Uniden Sportcat for $249, and the
Bearcat BC200XLT for $269. These seem to both have similar
feature (The 200XLT has a few more channels.) Can anyone offer
any advice on which may be better? Is the Sportcat modifiable
for extra freqs?

Thanks in advance.
-Larry

I believe Pleasanton has moved it's police ops to the trunked system used by
Livermore. Someone told me that happened not to long ago so Police Call may
be out of date.

7071. Re: Beyond Police Call

Newsgroup: rec.radio.scanner
Date: 1994-07-30 23:26:03 UTC
From: k1lho@aol.com
Message-ID: <31enib$gie@search01.news.aol.com>
Source record: 271118

In article <2raebn$nkd@panix2.panix.com>, schuster@panix.com (Michael Schuster) writes:

Haven't you heard their new slogan, You got the questions...We got the anwers
or ***STUMP THE MORON, What did you expect at RS.

Mike

7072. Re: Where find call codes?

Newsgroup: rec.radio.scanner
Date: 1994-07-30 23:44:03 UTC
From: k1lho@aol.com
Message-ID: <31eok3$gr3@search01.news.aol.com>
Source record: 271119

In article <2rl5cg$oia@search01.news.aol.com>, larryt1025@aol.com (LarryT1025) writes:

I don't know where you'r located, but if there is a "Scanner Master" available in
your area, they have an excellent listing of all the codes.

Mike

7073. Re: Helping cops by scanning-experiences?

Newsgroup: rec.radio.scanner

Please learn to use your editing and posting software properly.

You made it seem that =I= am the author of the drivel above. I am not.
You quoted nothing from whatever posting of mine that you replied to,
except the attribution, and then included nothing attribted to me.

One of the fastest ways to make enemies around here (besides having an aol
address) is to mis-quote people.

Apology accepted.

How can one determine in a Pro-2006 is cellular modifiable?

I understand the Pro-43 with the FCC No. ending with an "A" is not
modifiable. Does this hold true for the 2006?

Thanks.

F O R S A L E
Radio Shack Pro43 Scanner

* Pre-FCC ban -- already modified for cellular and TV reception

* 200 Channel, 10 bank EEPROM memory

* Triple Conversion (whatever that is)

* 6 months old, hardly used (I thought scanning would be fun -- it
is, but I never get around to using it)

* Original box, manual, and sales receipt included

* Batteries included (sold seperately by Radio Shack)

* Wall plug in transformer included (sold seperately by Radio Shack)

* I pay shipping and COD fees to US addresses

* All for $310.00

* If interested, reply by e-mail to:
Mike Crandall

Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

7082. Re: MARINE CELLULAR BAND ???

Newsgroup: rec.radio.scanner
Date: 1994-07-31 08:11:44 UTC
From: billn@hpcvaac.cv.hp.com
Message-ID: <1994Jul31.081144.3197@hpcvaac.cv.hp.com>
Source record: 271040

steven@sgb.oau.org (Steven Bradley) writes:
: I am sure you all get the picture by now. Someone is going to say
: "It is NOT EDCOs fault - they are only complying with the law to
: obtain FCC certification and sell the units in the U.S."
:
: Well it -> IS <- EDCOs FAULT, if they fail to take the parts they
: change and bag them and sell them. Here is why:
:
: The law does not cover kits, raw materials, components, and items
: which are not fully functional and complete. Selling the components
: they remove would BENEFIT THEM and US. We would readily get scanners
: in the US with more convenience. They would receive more sales.

This can be argued. While kits are not directly mentioned in the ECPA, they are mentioned, and regulated, by the FCC in other regulations. The FCC has also explicitly stated that frequency converters are banned, if they are able to convert the cellular frequencies. Of course, there are exceptions for the governmental agencies and people in the cellular phone business.

Now, it might be legal to sell the parts, as repair components.

: It is NOT illegal to do this. So why the h*ll aren't they presently
: planning to do so? Where is the law that says they can not do this?

See above.

: Since from the Factory, they come with cellular, and they remove it
: by something as simple as changing a component (adding/removing a
: component), WHY would the FCC approve such a unit next month? I mean
: it clearly violates the law as much as any other scanner from the
: past 3-5 years would have?

The FCC has said that the simple adding or removing a component is NOT sufficient to disable cellular frequencies - that would be "easy conversion". Now, if that component was a surface mount 20+ pin chip, then it would most likely be sufficient. Changing that would not be easy for the average person.

: Where did the law state "as simple as adding or removing a jumper,
: resistor, or cutting a trace"? I think it said adding or removing a
: component. MPUs -ARE- COMPONENTS, right?
:
: Now you see what I am getting at. It's about time someone took the
: government to court over the current line of scanners -- in that
: everyone of them (except the ICOMs where they removed the entire
: 800 mhz band) violates the rule of adding or removing a component,
: since that is the difference between international and domestic

: units.

The method of disabling was not specified. It just has to be "sufficiently difficult". That is determined by the FCC on a case by case basis, before they grant type acceptance.

Going to court would be a waste of both your and the taxpayer's money. The government left it to the FCC to determine how to implement the law. The FCC realizes that the law is stupid, unenforceable and impossible to fully implement. However, they have to do their best - and they will.

: Is there ANYTHING in the law dealing with preventing the dealers
: and manufacturers from selling the parts used in their overseas
: units -and- instructions to upgrade them to international capability?

Not that I know of. However, if it becomes common, the FCC will simply refuse to grant type acceptance to future models that do not have the rf section for 800 MHz completely removed.

: Remember, kits and parts are EXEMPT from the law. Not addressed once.

See above.

Bill

Bennett Z. Kobb (bkobb@newsignals.com) wrote:
: > Restrictions apply only to FCC type accepted receivers. Too many folks
: > are missing this point. Kits are not FCC type accepted.

[Mucho deleted]

: More to the point, do you think the cellular industry would have lobbied this
: thing for so long (it was not a cake walk for them to get the legislation) if
: there was an enormous loophole for kits? Don' be ridic.
^^^^^^^^^^^^^
First I won't be, I'll try to ignore this message you posted...

[Energizing Flame Mode - 75% power]

There IS a loophole. As an incomplete device, the END USER is the person responsible to ensure the complete device would meet the requirements of the law -- making it NOT illegal to sell the kit unassembled. Since a kit can be incomplete as you aptly put it, perhaps they left out the components and instructions to block the two areas of 800 mhz from the converter, leaving that up to the imagination of the manufacturer who assembles it (ie makes it, the END USER) as to how to make it comply. Selling it as a kit however, possibly lacking some minor components would get the company around the rules because the FCC could not hold them to having supply EVERYTHING needed to build it. Of course the END USER (home based manufacturer) would not bother with the extra ridiculuous expense of other components. The logical way around this if the FCC forced the issue would be simply to make the parts availabel as a third bag of stuff available for purchase in the U.S. to convert the converter to a legal US model. Of course, I would buy the third bag (provided for sale only for US government reasons) and simply NOT install those components.

[Engaging Turbo Flame Mode 110% power]

The silly stupid rules we are all IGNORING by going OUT OF THE US for our INTERNATIONAL COVERAGE SCANNERS called to prevent modifications and did not cover simply NOT installing components while building the device as they did not expect us to start doing so, dumb move, TDDRA IDIOTS. I'd like to shoot a few of them responsible.

In any event with the advent of new scanning methods and equipment (read that as USING MODIFIED CELLULAR PHONES AS MONITORING EQUIPMENT), what steps can a person take to get the Government (Hitler Regime in DC) to look at BANNING THE MANUFACTURE and IMPORTATION of CELLULAR PHONES because they can be used to monitor OTHERS conversations? I

mean heck, its a two way street.

Is it possible IN COURT to force the US to kill the cellular law as they relate to scanning equipment BECAUSE of the readily available inexpensive cell phones with instructions for monitoring basically kill any expectation of privacy while using an RF device? I would think so! Heck, I read all over how to modify every cellular phone made to make it monitor. It looks like the IDIOTS on capital hill really screwed up this time -- they caused an increased interest by even those who would not have normally been interested in such activity. I'll bet every congressman has a cellular capable scanner sitting someplace at home or in the office!

: > Nor did the FCC ever see fit to specifically ban kits as can be seen in
: > the text of the language that was finally adopted.

: It didn't have to specifically ban kits, because the ban applied to the devices
: period: both manufactured and kit versions.

: Can you imagine them saying, "Oops! We forgot to ban kits! What idiots we are:
: all this trouble to ban frequency converters and scanners and it doesn't matter
: cause they can still sell kits!" Not likely... ;-)

[Re-energizing Turbo Flame Mode -- quick-start!]

WRONG! WRONG! They DID NOT cover home made equipment where you sit
down and assembly it from parts, they covered manufactured and imported
COMPLETE devices. Furthermode, the devices had to be imported for USE
as opposed to carry/store/have/to hold/to possess/to display. That
hole alone is why we're all buying non US equipment now. I have a
nice display case here (so the US government would like to believe).

Anyhow, getting back to the converters... the FCC does NOT cover plans
to build something, nor do they cover bags of raw components, nor do
they cover boxes.

They MAY cover heathkit style kits where everything is included.

Are you suggesting that IF an article was to appear in one of the
popular Radio/Electronics magazines where it gave complete plans
for one of these converters, complete how-to description on what it
needs to build it, that this ARTICLE would need an FCC authorization?

I think -> NOT <-

And if that ARTICLE feature TWO or THREE suppliers of the components
needed to build that device, EACH SUPPLIER would need FCC authorization
to SELL those components -- BECAUSE they MAY be used to build an RF
device? HECK, this means that chokes, capacitors, RF coils, even
ferrite broadcast band antennas NOW require an FCC ID on them because
they COULD be used in an RF device to build a converter. NAZI GERMANY

US STYLE!

Again, I think -> NOT <-

Would the magazine publisher be required to build the device? I strongly suspect NOT. Since information is NOT illegal and RAW components, EVEN IF BAGGED are NOT under FCC jurisdiction.

Now, about them cases... Oh well... Now Radio Shack will need to get an FCC approval on EACH case/box they sell because it MAY be used to contain a converter or cell-receiver. HA HA HA HA

H H A !! H H A !!
H H A A !! A A A A !!
HHHHH AAAAA !! HHHHH AAAAA !!
H H A A !! H H A A !!
H H A A !! H H A A !!

You guys crack me up with your STUPID interpretations that a bag of parts, board, box, plans could require the FCCs blessing. HA!

I'll mention this one next time I am down at the Rat Shack -- tell them they need FCC ID numbers for the cases, capacitors, wire, because they are components which may be used to construct an RF device.

HA HA HA HA ... much laughter.

I also believe that instructions for TV descamblers an related kits would fall under this same false belief. IF that were so, why did the cable industry NOT lobby to have the FCC approval pulled on those "kits" too!?!?!?

[Flame Mode -- Stand By]

Seems to me we need to follow the NRA's lead. Let's ban together and form a lobbist group and print a monthly magazine. We need support from the major scanner manufacturers. We can then keep track of the politicians who vote for dumb radio related laws and then publish their names in the magazine to remind everyone not to vote for them. We also need to make sure we do VOTE so we can fire the non-desireables.

If we work at it and not just sit around and complain we might be able to do it. It's worth a try anyway.
Les

> Montana?
>

I'm not a scannist, but do know something about radio history and you may find this interesting.

Talk about "honor system", at one time background music companies used to sent their programming over regular FM stations. This was back in the 50's when no one really knew what FM radio was, much less had a receiver.

Here in NYC, a company called _Music To Buy By_ leased 12 hours a day, 9am to 9pm, 6 days a week, on WHOM-FM, (now Infinity's WKTU, the home of Howard Stern). When there was no music on Sunday, (NYC had blue laws back then), the station didn't go on the air. Muzak owned WBFM and had it's music on 24 hours a day. Today it still transmitts 2 of it's services on subcarriers on the successor station, (Tribune's WQCD).

Now what if you decided to "steal" the service for your store? Well Muzak had discovered that if you listened to their elevator music constantly, it would get on your nerves so they programmed in silent periods. This was about 10 minutes, just before the hour. The paying customer's service would be tripped into silence by a 25 Hz tone transmitted after the last song, (some customers had a special mechanical timer to shut it off instead). If you stole Muzak, you wound up getting a very annoying, droaning announcer doing long commercials for busineses that subscribed to the service. They really made you want to go to sleep. In what was a calculated move, they would start playing music and then interrupt it for the commercial and ID, that was worse than leaving the music on.

MTBB did something very different. The station had a continuous amount of annoying white noise on it, all the time, even over other programs on the station and the AM simulcast from midnight to signoff. Even after the service went out and another automated format was brought in, the white noise stayed for another 2 weeks until someone realized they should get rid of it.

Remember most radios didn't have tone controls on them back then so you couldn't filter it out, and even if your radio did have one, you would make the already low-fi music more muffeled. Subscribers got a receiver with a sharp cut-off filter.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Larry Claman (claman@speedway.net) wrote:
: I'm new to scanning & looking to buy a handheld for myself.
: A store near me has the Uniden Sportcat for $249, and the
: Bearcat BC200XLT for $269. These seem to both have similar
: feature (The 200XLT has a few more channels.) Can anyone offer
: any advice on which may be better? Is the Sportcat modifiable
: for extra freqs?

Larry,

I had a BC200XLT up until about 3 weeks ago. I then purchased the sportcat.a
I am now in the process of purchasing a used BC200XLT, why?

The BC200XLT allows you to input a range to scan, for example 154.00
-155.00 while you are scanning this range your 10 priorities are active
and you can still hear the police and fire in your area

The sportcan doesn't allow this. What it has is predetermined scanning
ranges and you can scan them up and down but you can't listen to the
priority and have to be there pressing the up and down button, thus
I don't really use it.

I'm glad I purchased the sportcat because of the size and I believe it scans
quicker, but I'm also going to get the BC200XLT.
C

I hope this help :)
Cheryl

Joseph Jesson (joe@netcom.com) wrote:

: What is the danger of customs seizing the scanner? I know you can
: use for Visa card for ordering scanners.

Well, for starters, no danger -- if it does not arrive, you have a chargeback issued on the card -- as they never delivered, and you cancel the order for same reason.

Next, the law says import or manufacture for USE. Use of a receiving device is listening. Period. Therefore, if you are importing for any other reason, it is not covered by the law. So for reasons of the law you are importing for "show", "exhibit", "storage for overseas trips", and lastly "possession", not use.

Last, the FCC/Customs can not prevent importation of NON FCC certified scanners because they do not provide an up front listing to the public OR the customs inspectors of what is not considered acceptable. Let's look at the facts, since its not certified, chances are it has not been even looked at by the FCC. Even if it has -- if there are units with the SAME model number here in the US, they still would not know if it complied with the USE restrictions. And if they were to try and stop importation of a scanner for any other reason, I'd most likely convert that limitation of USE into the other word they would not want to hear, namely SUE, as in lawsuit.

Since they have no standard by which to evaluate the scanners, there is no means to prevent them. Simple.

Since you can also order parts, it may be possible to order the US made model and upgrade it buy ordering the digital board as a replacement item from overseas -- that is guaranteed not to be a scanning receiver of four or more channels! Digital boards do not affect the actual tuning, therefore, you can change that part and presto -- readily modified!

{I still need an ASCII graphic for the outstreached middle finger to point at the FCC, anyone got one?}

>--

Cut the coppper trace from pin 80 on IC-1489 to L-201. Pin 80 should be the first pin on the left side of the IC, counting up from the diagonally cut corner.

7097. Re: My $.02 on Scanner Laws

Newsgroup: rec.radio.scanner
Date: 1994-07-31 18:17:11 UTC
From: sjking@freenet2.scri.fsu.edu
Message-ID: <31gpr7$8jg@freenet3.scri.fsu.edu>
Source record: 271049

Just to add my $0.015 (after taxes) worth...

Although I think the federal law prohibiting receiving unsrambled FM frequencies on the cellular phone band and state laws (California) prohibiting receiving unscramled FM signals on the cordless phone band are immoral and impractical, there are two issues: business and residential. I am not experienced with the business side, e.g., HBO in pre-scrambled days, but if a business' product is contained in the RF signal then receiving that signal without permission (or descramling an encrypted signal especially) would be like stealing a can of beans from Albertsons.

As for the issue of listening to the phone company's microwave links, that should be illegal because of the phone customer's reasonable expectation of privacy. If you use your landline telephone, you should be able to expect that your call will be private (unless the FBI is out to get you or the President doesn't like you). If you use an unencrypted cell phone or cordless phone, you should not have any expectation for privacy since your conversation is sent out into the ether for everyone with basic radio equipment can hear you. If the signal is encrypted, that is another thing. If it is encrypted, there is some level of privacy but not as much as using a normal phone.

The problem with current scanner laws is that they artificially creating a sense of security on VERY UNSECURE modes of communication. They are equivalent to, IMHO, making it illegal to listen if your neighbors talk to each other with bullhorns.

Greetings, all:

Forgive me if this has been posted and I missed it, but does anyone
have the frequencies used by the Confederate Air Force in their airshow
performances?

Many thanks,

^--^
x x Wombat
?

7101. ECPA Court Cases (query)

Newsgroup: rec.radio.scanner
Date: 1994-07-31 19:52:16 UTC
From: David Harpe <david_harpe@mm.cobb.ziff.com>
Message-ID: <CttLv4.In@zcias2.ziff.com>
Source record: 271065

Is anyone aware of a case where a person was arrested and charged in violation of the ECPA? Specifically, in violation of the sections regarding the monitoring of cellular phone calls. If so, were they convicted or acquitted?

I'm curious, simply because it's been around for awhile and I haven't heard of a test case. Am I living in a cave and missed it, or has it not happened yet?

David Harpe

Optoelectronics 3000A Product Review - September 1993
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
June 19th of 1993, I distributed a product review of Optoelectronics' 3000A handicounter. It had bad dBm calculations. A 29 July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. This version includes subsequent perspective after use of OE's M1 handicounter (see the M1 product review of this same date -- it is a pared down version of the 3000A). Damien Thorn (Internet drdamien@delphi.com) wrote a non-technical review article on several of OE's products (covering more why you'd want them and what to do with them once you own them) that appeared in the August 1993 issue of Nuts & Volts.

>>> ABSTRACT
A 10Hz-3GHz feature-laden counter/timer/frequency meter could be a good addition to your shack if you don't have the functionality yet. There are some disallowed configurations that give you less than you may think if you casually read the laundry list of features. Input specifications need more attention or at least acknowledgement of real-life problems.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is by the A input, apparently designed to provide a better "bite" into an interior copper shielding plate around the A input.

A single 9.2cm x 12.6cm circuit board lies under the faceplate, directly mounting the three buttons and six slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. My 8751 is labeled M1.3000A 5.20.93 VER 2.1 with a little sticky label. The two main chips and a transformer on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The six batteries are stuck to the back shell (double sided tape?). The two battery wires terminate on the circuit board with a separable connector. The batteries' weight and the solid aluminum case give the unit a solid feel. Neither the wall-wart charging unit or the 3000A itself have

a charging light. For the extra resistor and LED, I would like one. Too many times I've had some master switch, wall switch or loose plug inadvertently negate my effort to charge batteries. And when do you find out? When you needed the unit to be charged.

There are three plastic sheets stuck on the external top and face of the unit. My top piece was peeling off slightly. The front bottom one was crooked enough to let Button 2 not bounce back up. Slight trimming fixed that. I can't tell if the white lettering is applied on top of the plastic or behind the plastic. I hope it's behind so that they don't wear off. All the aluminum is painted black --not drippy, but it has the appearance of thick enamel. Personally, I would much rather have black anodized so there would be no possibility of chipping paint.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the 3000A is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Operation..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 pages
Operation hints..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper describes how to turn on the backlight option.

I wanted to know what I could plug into this meter. Nowhere in the specs or owner's manual are the max input ratings. After talking with the factory (toll call is small compared to the purchase price, but still is annoying), I find the 1 Mohm inputs can handle a maximum on the order of 50 volts AC+DC. The Model 3000 (not the 3000A) specified 100V RMS as the maximum. Anyhow, I feel good about plugging in TTL.

DON'T plug TTL into the inputs if the 50 ohm switch is selected! More subtly, be sure you *unplug* it before you slide the switch to the 50 ohm position. The same phone call revealed that the 50 ohm inputs handle a maximum of +15 dBm. That's 1.2 volts RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Another user was told by a factory technician that "a 5W HT connected to the counter input for a short time would not damage the counter." Five watts is about +37 dBm! Does the amount of time matter? The correct numbers need to be in an Owner's Manual, especially since the warranty excludes "damage to the input circuitry from the application of an excessive input signal."

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful. Full scale bar graph ranges from 2 - 4 mV, depending on the frequency. If you stay on scale, you're safe, but most of the valid input window is above "full scale." In the range 4 mV to approximately 1200 mV, you'll be increasing power "in the blind."

>>> OPERATION
Some non-obvious combinations of functions and inputs is the order of the day. This is kind of weird, but is intentional to give you the best sensitivity possible, using a number of specialized input amps.

Turn it on, holding down a Button 2 if you want the optional backlight to come on. Button 3 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers.

If you select Hi-Z inputs, Button 1 selects either/both A and B inputs. Button 2 rotates between FREQUENCY, PERIOD, INTERVAL, and RATIO. Input A measures only 10Hz - 50MHz, with sensitivity of a few tens of millivolts. Input B measures only 10Hz - 10MHz, with a sensitivity of better than ten millivolts.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of three input amps:

Input A only, from 10MHz - 220MHz (0.3 to 5mV sensitivity)
Input A only, from 10MHz - 880MHz (divide by 4 prescaler)
Input B only, from 500MHz - 3000MHz (new amp, div by 16 prescaler)

On one of OE's product literature flyers, they speak of a 1-200MHz input. A phone call confirmed that this range exists only as a typo on the product literature flyer.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) PERIOD, INTERVAL and RATIO are disabled. Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate count is acquired. A higher level of filtering can be selected by holding down Button 3 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate

count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
In some sense, there's not much to support. The meter either works or it doesn't. Operation is very straight forward. I don't call to harass service personnel and I *do* read the manuals first. I did call to find out about the input characteristics as discussed above and was, well, not impressed.

Female answers and I ask for service or tech help. After 2 minutes, the line drops dead. I call back. Same female passes me on to Ray quickly this time. I ask Ray about input specs. He says that, yes indeed, that has been inadvertently left out of the manual. Stand by. Three minutes. Ray comes back with info. The 1 Mohm inputs are "plus 50 volt AC plus DC", the 50 ohm inputs are "plus 15 dBm." Yes, that's what I wanted! Follow up: What do you mean by 50v AC+DC?" Hmmm. He didn't know; that's what the engineer told him. Ok. Is it capacitively coupled? Uhh.. the inputs go right into a "MAR6 amplifier." Could you please send me a copy of just the front end prior to the MAR6 amps? Pause... "Well, there's a capacitor that goes to ground." Yes, that's the kind of info I want. What size? Maybe a pf or two? "It's a 50v electrolytic." Eeee wrong person. Would he send me just a copy of the front end schematic? "No, we don't have anything like that I could send you." Ok, well thanks anyhow. Bye.

In retrospect, I should have asked for the engineer who was sourcing this information. Inputs are listed in the specifications as 1MHz, 30pf. This seems believable since it mimics a normal oscilloscope input. But are they AC or DC coupled? With what size, type & rating capacitor? I was hoping to use the INTERVAL or RATIO mode with Input B held open so I can count events on Input A. At Dayton a year back, I spoke with a man named Bill Owens who seemed to have a good handle on the company's history and the capability of the product line. I wish his knowledge was conveyed better to potential buyers.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100 KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the 3000A with a 20Hz - 1MHz function generator, my Yaesu 757GX/Vectronics VC300DLP combo, and a Hewlett-Packard VHF/UHF generator.

--- low frequency ---
For the less than 1MHz work, the Hi-Z inputs are used. I have a 1MHz TXCO standard in my shack that has an output floating on the back side of

a little toroid transformer. It gives out approximately +-0.5v into my 500 Kohm load (3000A and oscilloscope in parallel). My 1MHz output shows up as a stable 6.00 Mhz on the 3000A. What?! Yes. Regardless of the filter selection (none, medium, or full), six megahertz kept being displayed. The waveform was not symmetric, I'll give that much, but it was very stable and clean from other high frequency hash. It looked sort of like this:

```
|\ |\ The waveform stayed the same regardless of
0 V___| -- | -- whether the 3000A was hooked up. The 3000A
| | | | counted the same regardless of whether the
-. .---. o'scope was hooked up. P-P voltage was 1.5v.
```

The 1MHz output from my TXCO was a square wave ranging between 0 and 2 volts. Regardless of the 3000A filter selection, it showed a frequency of 3.0 MHz. Another user working on a homebuilt oscillator also reports extreme sensitivity to harmonics. This harmonic sensitivity, combined with extreme sensitivity makes the instrument virtually useless when using any frequency multiples in your project: you won't know which signal is being locked onto.

I fired up a variable frequency / variable amplitude function generator and o'scope combination. The generator went to the scope with a BNC T-tap half way that plugged into the 3000A.

Using the A input, I needed incredulously large amplitudes--WAY above the specified <20 mV. Using the B input was even worse. The procedure used was to start at about 100 mV and go down first. If a stable count held, I reduced the PP voltage until spuratic readings were obtained. If 100 mV was giving spuratic or known-to-be-wrong numbers, I turned the amplitude up until a stable reading was obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency	Input A	Input B
20 Hz	2 V (0.78 VRMS)	*
200 Hz	1 V	*
350 Hz	0.6 V	*
60 KHz	50 mV	4 V
500 KHz	<10 mV	1 V

Square wave counting was similar. For instance, 2 V PP was needed at 10 KHz to get a good count with Input A. In all cases, the scope showed clean signals with no high frequency hash. Testing at another ham's shack who had a fancy HP generator and scope yielded the same results within 10%. Stable operation of the Hi-Z input is mandatory to use the interval and period functions of the 3000A, and this condition does NOT seem to be met. I consider the non-frequency modes to be historical carry-overs from the product lines' 7226 counter heritage rather than useful features of OE's OE10 custom chip.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With full output from the PK232 (about 0.5v PP on the scope, giving 140mV RMS on a Fluke DVM good to 10KHz), I stuck the tones into Input A and Input B with Hi-Z amps selected. The 2200Hz tone showed as 2265+-5Hz (A) and 23KHz (B), respectively. The 1200Hz tone showed as 1820+-15 (A) and 31KHz (B), respectively. No, I did not adjust the PK232.

--- high frequency ---
My RF test goal was simple. How accurate is my 757GX VFO? Working near 10MHz, the Lo-Z A input (only one suitable for this measurement) has an advertised sensitivity of <5mV. With a 12" dangling wire near the coax out the back of the radio, the counter was dominated with a signal at approximately 104 MHz (103.9 FM?). Later tests 25 miles across town again showed that with a wire pigtail antenna, it was being dominated with this station. I bought an RS15-577B FM trap and put it in line. Now a 68 MHz interference dominates, probably the local Channel 4 TV station.

I went back to the Hi-Z inputs. At this point I was trying to determine the electrical length of some coax. A 1/4 wavelength of coax is terminated with a short circuit, and fed in parallel with a 50 ohm load with a mid level RF power (see page 74 of the June 93 QST; the goal is to get a 1:1 SWR). The high current node at the terminator is the point I was trying to pickup RF with the 3000A. Twenty turns of perfboard wire around a pencil stepped up the voltage enough for the meter to register stable counts when the pickup coil was positioned near the end of the coax shorting wire loop.

Characterization of the three 50-ohm amps with an HP generator showed solid frequency locks at these random check points:

Fast Amp	Middle Amp	Slow Amp
800MHz, -47dBm, 1.0mV	100MHz, -65dBm, 0.12mV	150MHz, -60dBm, 0.22mV
1000MHz, -43dBm, 1.6mV	450MHz, -54dBm, 0.45mV	

Attempts to do PERIOD, INTERVAL, and RATIO measurements were unsuccessful due to the skittish behavior of the Hi-Z inputs.

>>> OPTIONS
You can buy a precision (0.2 ppm vs 1.0 ppm) timebase for an extra $100. What used to be a $45 backlight option now seems to be a non-optional extra expense. September advertisements still quote the lower price for the standard model, but the sales personnel won't sell one that way.

--- time base ---
There are two reasons why I did not want to buy the precision time-base option. One is because a RATIO mode is provided and I already have a precision 10MHz TTL oscillator scavenged from an old LORAN navigation board. 10MHz also happens to be the maximum frequency Input B accepted in the ratio mode (all ratios are A/B). What a coincidence. Works for me!

The second reason is simply that the 1ppm timebase is specified to age at a rate of 1ppm/year. A 0.2 ppm option would be degraded to the 1.0ppm option in only about 10 weeks. In any case, I usually don't need to know the last 2 Hz on a 10000000 Hz signal.

--- backlight ---
When it's on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or frequency is acquired.

It looks good. Worth $45? The native display is plenty readable and the extra light actually makes reading it harder from angles "above" the counter.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 2400bps, 8 bits, no parity, 1 stop bit. It only works in FREQ mode. It provides only the most recent number, with no indication of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. Sometimes it's even a burden. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by 10-15dB. Specified sensitivity ranges from -57dBm to -11dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about -11dBm. Play with those numbers and you'll see that the window for a good count can be pretty small. Try to measure a cordless phone near your transmitter or computer monitor? Probably not. If you live near a broadcast station, good luck. I don't consider these numbers a design flaw given the intentionally wide frequency range of the amps, but it definitely affects your day-to-day operation.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. Wide range frequency coverage means susceptibility to noise. A bandwidth limiting antenna helps mitigate this problem.

>>> SUMMARY
The at-your-door price for a 3.5" x 5" circuit board seems a bit high, but the counter is specified to do what I need it to do, plus a few options. Resolving the skittish Hi-Z input problems is a must. The M1 gets around this by simply not having multifunction capability. Paying the extra $100 for a 3000A with specified capabilities that in real life are marginally usable deserves a second thought.

All models are available only direct from the manufacturer in Florida. Contact Optoelectronics: 5821 NE 14th Avenue, Ft Lauderdale, FL 33334. 800-327-5912 or 305-771-2050. FAX 305-771-2052. Makes you want to dial ..2051 and see who you get, doesn't it? :)

Optoelectronics M1 Product Review - July 1994
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
In June of 1993, I distributed a product review of Optoelectronics' 3000A on Packet and Internet networks. It had bad dBm calculations. A July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. Since then, I purchased an M1 counter and this review reflects the new experiences. A third version of the 3000A review was distributed concurrently in September 1994. This version includes reference to the QEX article I wrote and describes backlight problems.

>>> INTRO
A 10 Hz - 2.4 GHz frequency meter could be a good addition to your shack if you don't have the functionality yet. The M1 is essentially a pared down version of the 3000A. At many places, this review assumes you have experience with the 3000A or have read that review. The 3000A I owned for a short while was returned because it was too tender and vulnerable to real-life conditions. Since then I've purchased an M1 and intend on keeping it. It is my recommendation to most people.

A non-technical review of OE's products (covering more why you'd want them and what to do with them once you own them) written by Damien Thorn (Internet damien@prcomm.com) appeared in the August 1993 issue of Nuts & Volts. He sounds like he enjoys his 3000A. I prefer the M1. The M1 costs $100 less. The July 1994 issue of QEX published an article of mine that described hardware and software projects to collect and display data collected from the counter's digital port.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is apparently designed to provide a better "bite" into an interior copper shielding plate around the input. The gate LED on the M1 protrudes excessively from the LCD panel, unlike the 3000A LED, which was mounted to the same height as the switches and pushbuttons. Looking inside, it is clear that 5 minutes with a soldering gun could lower the LED down to surface level. When my unit is out of warrantee, that's what I'll do.

A single 6.5cm x 11.7cm circuit board lies under the faceplate, directly mounting the two buttons and five slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD

display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. The two main chips on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The M1 has four battery cells. Literature claims a recharge lasts about an hour less than the 3000A. My M1 ran for 6:50 on a full charge. The low battery indicators, although functional during the power-on check, never did illuminate during the battery run-down check. The counter just quit counting and a minute or two later the display faded.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the M1 is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Controls..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 blank pages
Using the Counter..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper gives an overall Block schematic.

The max input ratings match the 3000A. The 1 Mohm inputs handle a maximum on the order of 50 volts AC+DC (specified as 100 V RMS in the product literature flyer).

The 50 ohm switches have MUCH less range! Be sure you *unplug* large voltage sources (such as TTL) before you slide the switch to the 50 ohm position. They handle a maximum of "+15dBm or 50 milliwatts". These numbers don't quite match by my calculation (+15dBm is 32 mW). The range corresponds to approximately 1.2 RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Accurate numbers need to be available.

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful and use the bargraph. Full scale bar graph ranges from 10-20 mV, depending on the frequency. This covers a large range than the 3000A and seems to cover the range of real-life sig-

nals better, but it is less sensitive.

>>> OPERATION
Turn it on, holding down a Button 2 if you want the optional backlight to come on. When the backlight is on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or frequency is acquired. After about 9 months of ownership, I had to return my M1 to the factory (under warrantee) to repair the backlight. The glow strip behind the entire display illuminated only the left side. It gradually faded to no light at all on the right side of the display.

Button 2 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers. The M1 has only one input, and is incapable of period, ratio, and interval measurements.

If you select Hi-Z input, you can count 10Hz - 50MHz, with a claimed sensitivity of a few tens of millivolts, identical to the 3000A Input A.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of two input ranges:

10MHz - 200MHz (3 stage amp)
10MHz - 2400MHz (2 stage amp, divide by 64 prescaler)

The M1's 50 ohm input covers the entire range 10-2400 MHz, whereas the 3000A allows selection of 10-220 MHz or 10-800 MHz on the A input and provides 500-3000 MHz on the B input. The M1 has slightly less advertised sensitivity (blank entries imply no published specification):

MHz	M1	3000A
10	5 mV	5 mV
150	0.3 mV	0.3 mV
200	0.45 mV	
400	0.6 mV	
800	3 mV	3 mV
1000	10 mV	1 mV
2000	5 mV	
2400	50 mV	
3000	60 mV	

The M1 bargraph has a full scale reading of 10-20 mV, whereas the 3000A has a full scale reading of 2-4 mV (dependent on frequency in both cases). It has ten RF bandwidth/display resolution combinations (same as the 3000A), but because it has only two RF ranges, each range has more gate time selections. I *still* don't understand what the sense is providing more than 6 digits of resolution with a 1ppm time base. This misleading "resolution" continues to be an Optoelectronics selling point and is inappropriately echoed by others.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate count is acquired. A higher level of filtering can be selected by holding down Button 1 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
Optoelectronics employees are professional and are helpful on the business end of things. Raw technical knowledge and, thus, the ability to help diagnose problems or give application suggestions is, in my experience, limited to only one person. See the 3000A product review for details of my experiences.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the M1 with a 20 Hz - 1 MHz Heath EUW-27 function generator, my Yaesu 757GX/Vectronics VC300DLP combo, an ADD8000 analog/digital prototype station, a Fluke 8000A DVM, and a Solaritron CD1400 oscilloscope.

--- low frequency ---
For the less than 10MHz work, the Hi-Z inputs must be used. I have a 2 MHz TXCO standard in my shack that has an output floating on the back side of a little toroid transformer. It gives out approximately +-0.8v with an output resistance of 100 ohms. The 2 MHz output shows up as a stable 1.999947 MHz on the M1. The waveform was not symmetric, but it was very stable and clean from other high frequency hash. It looked sort of like this:

-. .---. The waveform stayed the same regardless of
| | | whether the M1 was hooked up. The M1
| --. | -- counted the same regardless of whether the

./ ./ o'scope was hooked up. P-P voltage was 1.7v.

The 1 MHz TTL tap from the TXCO was a square wave ranging between 0 and 3.8 volts. Regardless of the M1 filter selection, it showed a stable frequency of 0.999974 MHz. These tests came out MUCH better using the M1 than the 3000A.

I next fired up the Heath variable frequency / variable amplitude function generator. I needed large amplitudes--WAY above the specified 10-20 mV. The procedure used was to start at about 1 V and decrease the voltage. If a stable count held, I reduced the PP voltage until spuratic readings were obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency	sine	square
20 Hz	*	35 mV
200 Hz	2.7 V	12 mV
60 KHz	1.8 V	15 mV
500 KHz	70 mV	20 mV

In all cases, the scope showed clean signals with no high frequency hash. For the two lowest frequency square wave measurements, hand placement while adjusting the voltage level significantly affected the required amplitude. Best (lowest) voltages are reported above.

The results for the sine wave signals are about 2x worse than the 3000A Input A response, but incalculably better than the 3000A Input B response. The M1 responded well to square waves whereas the 3000A did not.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With nominal output from the PK232 (130mV RMS on the Fluke, good to 10KHz), I measured the tones with the default digital filtering of the M1 engaged. The 2200Hz tone showed as 2272+-1, the 1200 Hz tone showed as 1278+-9 (14 samples each, standard deviation reported).

--- high frequency ---
My RF test goal was simple. How reliable is measurement of my 757GX VFO? Working at 15 MHz, the Lo-Z input (only one suitable for this measurement) has an advertised sensitivity of 5 mV. I used a scanner antenna, supported about and inch away from a resistor I used as a load. The counter's bargraph was about 3/4 scale deflection from the ambient noise. The transmitter's VFO was allowed to stabilize or about half and hour and then brought to within 5 Hz of WWV's 15 MHz carrier. Transmitting 25 watts into the dummy load resistor, the counter hit full scale bargraph and displayed a frequency of 15.012 MHz. At 100 watts, the M1 displayed 15.001 MHz. Accuracy doesn't look so good under reasonable ham shack conditions, but the M1's 50 ohm input is at least usable whereas the 3000A's was not under similar circumstances.

>>> OPTIONS
You can buy a precision (0.2ppm vs 1.0ppm) timebase for an extra $100.

Again, I stayed away from the 0.2 ppm precision timebase because specified aging would quickly degrade me back to the standard 1.0 ppm timebase. Additionally, I don't often need to know the last 2 Hz on a 10000000 Hz signal. As with the 3000A, the electroluminescent backlight is no longer an option-- the standard price is just higher.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 4800bps, 8 bits, no parity, 1 stop bit. It provides only the most recent number, with no indication of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by a claimed 10-15 dB. Specified sensitivity ranges from -57dBm to -13dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about 3/4 scale on the bargraph when using an AR100XLT scanner antenna. Since the scale goes from -56 to -26 dBm, that's roughly a -33 dBm noise floor. Adding in the 15 dB overhead for a good measurement gives -18 dBm required signal. That would be 8 dBm above full scale, roughly 3 bar segments. This matches real life experience of the Yaesu 757GX related above.

The Hi-Z M1 input handles square waves better than sinusoids, whereas the 3000A showed terrible susceptibility to harmonic lock-on with non-sinusoidal waveforms -- both for me and the other friend spoken of above. He was trying to measure a frequency multiplying class C VFO and confusion as to which stage was being measured made the meter unusable. On another project, anywhere near a 50 KHz switching power supply, measurements were dominated by it. He asks "would I have this problem with a TEK or HP counter?" I don't know. I know my extensive experience with a 7226B counter in the 1 to 10 MHz range showed none of the bizarre behavior seen with this (and the 3000A) high sensitivity counter. Triggering of these counters is just erratic. Perhaps a DC trigger with variable threshold adjustment would be better. OE's digital filtering DOES help, but often the filter is fooled or else specified sensitivity is unattainable.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. The M1's bargraph covers the range of real-life, on-the-air signals much better; it actually moves around rather than being saturated most of the time. The required 10-15 dB spread between noise and desired signal appears as 3 to 4 bargraph segments on the 16-segment display. The 3000A and the M1 appear to be optimized to do off-the-air measurements. In this role, using the M1, I've had fun snagging frequencies used by all sorts of Air Force base agencies in a manner just as Damien described. In the lab, using hard-wire connections, the Hi-Z inputs of the M1 don't measure up to specs and

the 3000A inputs seem downright unusable.

>>> SUMMARY
Paying $100 less for a M1 balances against having only one input and loosing the extra modes of operation. Because these extra modes relied on the unreliable Hi-Z inputs, I don't miss them. I am extremely interested in hearing reports from others in the field that have success or failure with the M1 and 3000A Hi-Z inputs.

All models are available only direct from the manufacturer in Florida. Contact Optoelectronics: 5821 NE 14th Avenue, Ft Lauderdale, FL 33334. 800-327-5912 or 305-771-2050. FAX 305-771-2052. Makes you want to dial ..2051 and see who you get, doesn't it? :)

Chuck,

Point well taken. Looks like this topic has started people thinking, remember this at the elections!

Andy

Please share the resource's names! Man, scanners are now contraband!

If the feds put this much emphasis on crime control we'd really be in great
shape! Watch out, he's got a scanner!

New Jersey comes about as close to a Gestapo state as it gets here. I
escaped from New Jersey years ago. The Jersey legislators are considering
a $500 tax/transmitter antenna for 'environmental' safety reasons. That
would have included CB, ham, and commercial sites. If that's not trying
to restrict an individuals communications rights/priviledges...

I think if that law would come into being you'd see indoor attic antennas
become a boom industry.
